Lab Objective

This lab will enable you to gain hands on experience with OSPFv3 and both IBGP/EBGP IPv6 and provide IPv6 connectivity for hosts on different subnets through 2 different BGP AS networks.

Lab Overview

This lab as shown in Figure 1 has the following different types of IPv6 addresses: loopback, link local, unique local, documentation addressing.

Refer to <https://www.ripe.net/manage-ips-and-asns/ipv6/ipv6-address-types> for an explanation of the different address types.

It's recommended an IPv6 calculator such as http://www.gestioip.net/cgi-bin/subnet_calculator.cgi be used to help understand subnet summarization. User/device LAN subnets are standardized to subnets with /64 mask.

2001:db8:beef:X::/128 are considered part of the "Documentation" 2001:db8::/32 range and are "Loopbacks" as they have /128 subnet mask.

2001:db8:beef:111::/64 on Switch1 and 2001:db8:beef:101::/64 on Switch4 is considered part of the "Documentation" 2001:db8::/32 range

fd00:1:X::/127 between Switches are part of the “Unique Local” fc00::/7 range, as a best practice /64 are reserved for inter switch links but /127 are actually used, e.g. fd00:1:13::/64 is reserved for Switch1 to Switch3 link, but fd00:1:13::/127 is used as only 2 IPs are required on that link.

Switch1, Switch2, Switch4 are part of AS#65001, Switch2 functions as Route Reflector (RR) in AS#65001

Switch3 is part of #65002.

The objective of this lab is to:

- Provide IPv6 connectivity between the 2 hosts across the IPv6 network with 2 different AS numbers
- Gain experience with both IBGP and EBGP using IPv6

Lab Network Layout

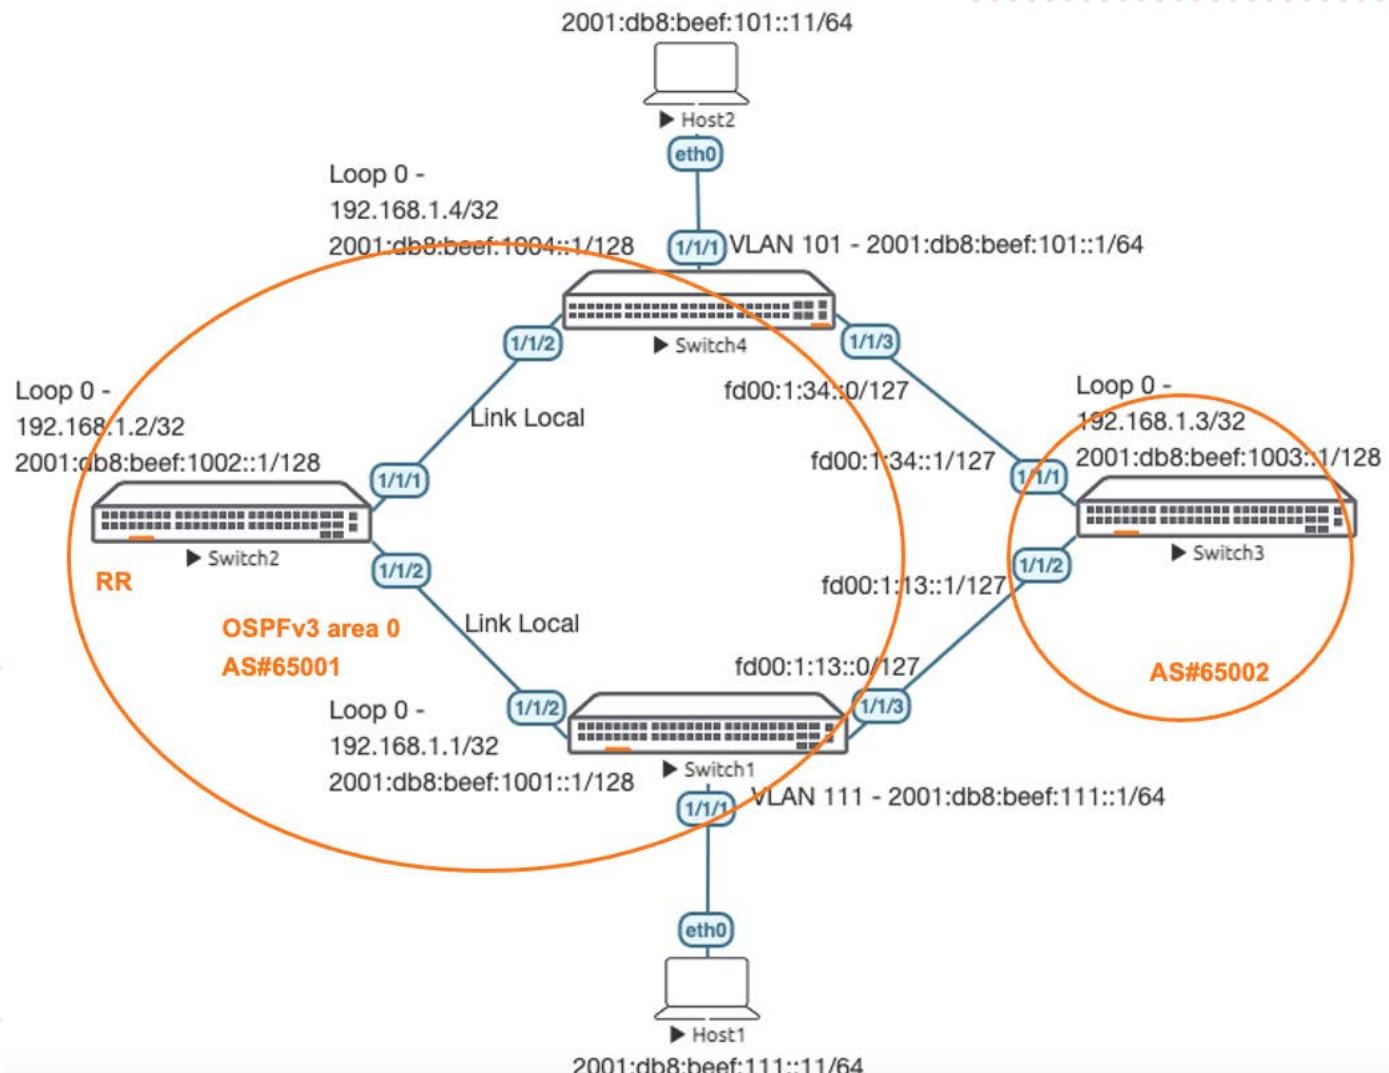

Figure 1. Lab topology and addresses

Lab Tasks

Task 1 – Lab setup

For this lab refer to Figure 1 for topology and IP address details.

- Start all the devices, including hosts
 - Open each switch console and log in with user “admin” and hit enter, so that no password is applied
 - Set your desired password
 - Change all hostnames as shown in the topology:
- ```
configure
hostname ...
```
- On all devices, bring up required ports:
- ```
int 1/1/1-1/1/6
  no shutdown
use "exit" to go back a level
```

- Validate LLDP neighbors appear as expected on each switch

```
show lldp neighbor
```

Switch1

```
Switch1(config)# sh lld nei
```

```
LLDP Neighbor Information
=====
```

```
Total Neighbor Entries      : 2
Total Neighbor Entries Deleted : 0
Total Neighbor Entries Dropped : 0
Total Neighbor Entries Aged-Out : 0
```

LOCAL-PORT	CHASSIS-ID	POR-T-ID	POR-T-DESC	TTL	SYS-NAME
<hr/>					
1/1/2	08:00:09:8a:14:fa	1/1/1	1/1/2	120	Switch2
1/1/3	08:00:09:12:8e:9e	1/1/2	1/1/2	120	Switch3

Task 2 – Configure IPv6 address and Interfaces

- Configure interfaces, IPs and required VLANs on these 4 switches

Switch1

```
Switch1(config-if)# int 1/1/2
Switch1(config-if)# ipv6 address link-local
! link-local addresses can be used for OSPFv3 peering between switches in the same AS#
Switch1(config-if)# int 1/1/3
Switch1(config-if)# ipv6 address fd00:1:13::0/127
! either unique local or global unicast addresses should be used for direct EBGP peering
Switch1(config-if)# int lo 0
Switch1(config-loopback-if)# ipv6 address 2001:db8:beef:1001::1/128
Switch1(config-loopback-if)# ip add 192.168.1.1/32
! IPv6 address on loopback is only used for connectivity tests in this lab
! IPv4 address on loopback is mandatory for OSPFv3 and BGP IPv6 deployment
Switch1(config)# vlan 111
Switch1(config-vlan-111)# int vlan 111
Switch1(config-if-vlan)# ipv6 address 2001:db8:beef:111::1/64
! User/device LAN subnets are standardized to /64 mask
```

```

Switch1(config-if-vlan)# no ipv6 nd suppress-ra dnssl
Switch1(config-if-vlan)# no ipv6 nd suppress-ra rdnss
! IPv6 Router Advertisements (RAs) are suppressed by default
! disable RA suppression so that IPv6 hosts are able to receive default gateway info
Switch1(config)# int 1/1/1
Switch1(config-if)# no routing
Switch1(config-if)# vlan access 111

```

Switch2

```

Switch2(config)# int 1/1/2
Switch2(config-if)# ipv6 address link-local
! link-local addresses can be used for OSPFv3 peering between switches in the same AS#
Switch2(config-if)# int 1/1/1
Switch2(config-if)# ipv6 address link-local
Switch2(config-if)# int lo 0
Switch2(config-loopback-if)# ipv6 address 2001:db8:beef:1002::1/128
Switch2(config-loopback-if)# ip add 192.168.1.2/32
! IPv6 address on loopback is only used for connectivity tests in this lab
! IPv4 address on loopback is mandatory for OSPFv3 and BGP IPv6 deployment

```

Switch3

```

Switch3(config)# int 1/1/2
Switch3(config-if)# ipv6 add fd00:1:13::1/127
! either unique local or global unicast addresses should be used for direct EBGP peering
Switch3(config-if)# int 1/1/1
Switch3(config-if)# ipv6 add fd00:1:34::1/127
Switch3(config-if)# int lo 0
Switch3(config-loopback-if)# ipv6 address 2001:db8:beef:1003::1/128
Switch3(config-loopback-if)# ip add 192.168.1.3/32
! IPv6 address on loopback is only used for connectivity tests in this lab
! IPv4 address on loopback is mandatory for OSPFv3 and BGP IPv6 deployment

```

Switch4

```

Switch4(config)# int 1/1/2
Switch4(config-if)# ipv6 address link-local
! link-local addresses can be used for OSPFv3 peering between switches in the same AS#
Switch4(config-if)# int 1/1/3
Switch4(config-if)# ipv6 address fd00:1:34::0/127
! either unique local or global unicast addresses should be used for direct EBGP peering
Switch4(config-if)# int lo 0
Switch4(config-loopback-if)# ipv6 address 2001:db8:beef:1004::1/128
Switch4(config-loopback-if)# ip add 192.168.1.4/32
! IPv6 address on loopback is only used for connectivity tests in this lab
! IPv4 address on loopback is mandatory for OSPFv3 and BGP IPv6 deployment
Switch4(config-if)# vlan 101
Switch4(config-vlan-101)# int vlan 101
Switch4(config-if-vlan)# ipv6 add 2001:db8:beef:101::1/64
Switch4(config-if-vlan)# no ipv6 nd suppress-ra dnssl
Switch4(config-if-vlan)# no ipv6 nd suppress-ra rdnss
! RAs are suppressed by default
! disable RA suppression so that IPv6 hosts are able to receive default gateway info
Switch4(config-if-vlan)# int 1/1/1
Switch4(config-if)# no routing
Switch4(config-if)# vlan access 101

```

Task 3 – Enable OSPFv3 between peers in AS#65001

- Enable IPv4 router ID and enable OSPFv3 on Lo0 and inter switch links

switch1

```
Switch1(config)# router ospfv3 1
Switch1(config-ospfv3-1)# router-id 192.168.1.1
Switch1(config-ospfv3-1)# area 0
Switch1(config-ospfv3-1)# int lo 0
Switch1(config-loopback-if)# ipv6 ospfv3 1 area 0
Switch1(config-loopback-if)# int 1/1/2
Switch1(config-if)# ipv6 ospfv3 1 area 0
Switch1(config-if)# ipv6 ospfv3 network point-to-point
```

switch2

```
Switch2(config)# router ospfv3 1
Switch2(config-ospfv3-1)# router-id 192.168.1.2
Switch2(config-ospfv3-1)# area 0
Switch2(config-ospfv3-1)# int lo 0
Switch2(config-loopback-if)# ipv6 ospfv3 1 area 0
Switch2(config-loopback-if)# int 1/1/2
Switch2(config-if)# ipv6 ospfv3 1 area 0
Switch2(config-if)# ipv6 ospfv3 network point-to-point
Switch2(config-if)# int 1/1/1
Switch2(config-if)# ipv6 ospfv3 1 area 0
Switch2(config-if)# ipv6 ospfv3 network point-to-point
```

switch4

```
Switch4(config)# router ospfv3 1
Switch4(config-ospfv3-1)# router-id 192.168.1.4
Switch4(config-ospfv3-1)# area 0
Switch4(config-ospfv3-1)# int lo 0
Switch4(config-loopback-if)# ipv6 ospfv3 1 area 0
Switch4(config-loopback-if)# int 1/1/2
Switch4(config-if)# ipv6 ospfv3 1 area 0
Switch4(config-if)# ipv6 ospfv3 network point-to-point
```

- Validate OSPFv3 neighbors come up as expected

```
Switch2# sh ipv6 ospfv3 nei
VRF : default          Process : 1

Total Route Count : 2

Task 4 – Enable IBGP using IPv6 between peers in AS#65001

- After OSPFv3 provides loopback connectivity between the switches in AS#65001, you can proceed to establish IBGP peering with AS#65001

Switch1

```
Switch1(config)# router bgp 65001
Switch1(config-bgp)# neighbor 2001:db8:beef:1002::1 remote-as 65001
Switch1(config-bgp)# neighbor 2001:db8:beef:1002::1 update-source lo 0
Switch1(config-bgp)# address-family ipv6 unicast
Switch1(config-bgp-ipv6-uc)# neighbor 2001:db8:beef:1002::1 activate
Switch1(config-bgp-ipv6-uc)# network 2001:db8:beef:111::/64
! Peer to RR using Lo0 and advertise LAN subnet
```

Switch4

```
Switch4(config)# router bgp 65001
Switch4(config-bgp)# router bgp 65001
Switch4(config-bgp)# neighbor 2001:db8:beef:1002::1 remote-as 65001
Switch4(config-bgp)# neighbor 2001:db8:beef:1002::1 update-source lo 0
Switch4(config-bgp)# address-family ipv6 unicast
Switch4(config-bgp-ipv6-uc)# neighbor 2001:db8:beef:1002::1 activate
Switch4(config-bgp-ipv6-uc)# network 2001:db8:beef:101::/64
! Peer to RR using Lo0 and advertise LAN subnet
```

Switch2

```
Switch2(config)# router bgp 65001
Switch2(config-bgp)# neighbor 2001:db8:beef:1001::1 remote-as 65001
Switch2(config-bgp)# neighbor 2001:db8:beef:1004::1 remote-as 65001
Switch2(config-bgp)# neighbor 2001:db8:beef:1001::1 update-source lo 0
```

```

Switch2(config-bgp)# neighbor 2001:db8:beef:1004::1 update-source lo 0
Switch2(config-bgp)# address-family ipv6 unicast
Switch2(config-bgp-ipv6-uc)# neighbor 2001:db8:beef:1001::1 activate
Switch2(config-bgp-ipv6-uc)# neighbor 2001:db8:beef:1004::1 activate
Switch2(config-bgp-ipv6-uc)# neighbor 2001:db8:beef:1001::1 route-reflector-client
Switch2(config-bgp-ipv6-uc)# neighbor 2001:db8:beef:1004::1 route-reflector-client
! Peer to RR clients using Lo0

```

- Validate IPv6 IBGP peering, notice IPv4 on Lo0 is used as router identifier

```

Switch2# sh bgp ipv6 unicast summary

Total Route Count : 7

Task 6 – Allow backup path via EBGP AS

- If you shut down the uplink on Switch1 to Switch2

```
Switch1(config)# int 1/1/2
Switch1(config-if)# shu
```

- You will notice the 2001:db8:beef:101::/64 route from Switch4 no longer exists on Switch1 even though a backup path via Switch3 (AS#65002) exists

```
Switch1(config-if)# do sh ipv6 route
Displaying ipv6 routes selected for forwarding

Origin Codes: C - connected, S - static, L - local
               R - RIP, B - BGP, O - OSPF
Type Codes:   E - External BGP, I - Internal BGP, V - VPN, EV - EVPN
               IA - OSPF internal area, E1 - OSPF external type 1
               E2 - OSPF external type 2

VRF: default
```

Metric	Prefix Distance/ Age	Nexthop	Interface	VRF(egress)	Origin/ Type
2001:db8:beef:111::/64 [0/0]	-		vlan111	-	C
2001:db8:beef:111::1/128 [0/0]	-		vlan111	-	L
2001:db8:beef:1001::1/128	-		loopback0	-	L

```
[0/0]      -
2001:db8:beef:1003::1/128  fd00:1:13::1          1/1/3      -
                                         B/E
[20/0]     01h:25m:08s
fd00:1:13::/127             -                  1/1/3      -
                                         C
[0/0]      -
fd00:1:13::/128            -                  1/1/3      -
                                         L
[0/0]      -

Total Route Count : 6
```

- This is because the 2001:db8:beef:101::/64 route originates from the same AS#65001, which is ignored by default when learnt via EBGP

- You will need to use the `allowas-in` command to import the route from AS#65001 learnt from AS#65002

```
Switch1(config)# router bgp 65001
Switch1(config-bgp)# address-family ipv6 unicast
Switch1(config-bgp-ipv6-uc)# neighbor fd00:1:13::1 allowas-in 2
```

```
Switch4(config)# router bgp 65001
Switch4(config-bgp)# address-family ipv6 unicast
Switch4(config-bgp-ipv6-uc)# neighbor fd00:1:34::1 allowas-in 2
```

Task 7 – Configure Hosts

- Configure Host1 with your desired IP and auto default gateway (static IPv6 default gateway does not work in VPCS)

```
VPCS> ip 2001:db8:beef:111::11/64 auto
PC1 : 2001:db8:beef:111::11/64
```

- Verify Host1 has your desired IP and router info from RA

```
VPCS> sh ipv6
```

```
NAME           : VPCS[1]
LINK-LOCAL SCOPE : fe80::250:79ff:fe66:6805/64
GLOBAL SCOPE   : 2001:db8:beef:111::11/64
DNS            :
ROUTER LINK-LAYER : 08:00:09:16:7b:7e
MAC             : 00:50:79:66:68:05

RHOST:PORT     : 127.0.0.1:30000
MTU             : 1500
```

- Configure Host2 with your desired IP and auto default gateway (static IPv6 default gateway does not work in VPCS)

```
VPCS> ip 2001:db7:beef:101::11/64 auto
PC1 : 2001:db7:beef:101::11/64
```

- Verify Host2 has your desired IP and router info from RA

```
VPCS> sh ipv6
```

```
NAME           : VPCS[1]
LINK-LOCAL SCOPE : fe80::250:79ff:fe66:6807/64
GLOBAL SCOPE   : 2001:db7:beef:101::11/64
DNS            :
ROUTER LINK-LAYER : 08:00:09:ee:11:82
```

```
MAC : 00:50:79:66:68:07
LPORT : 20000
RHOST:PORT : 127.0.0.1:30000
MTU : 1500
```

Task 8 – Final Validation

- Ensure unicast connectivity works between hosts and towards loopbacks

```
From Host1
VPCS> ping 3001:101::11
3001:101::11 icmp6_seq=1 ttl=58 time=3.079 ms
3001:101::11 icmp6_seq=2 ttl=58 time=3.136 ms
```

```
VPCS> ping 2001:db8:beef:1002::1
2001:db8:beef:1002::1 icmp6_seq=1 ttl=63 time=4.278 ms
2001:db8:beef:1002::1 icmp6_seq=2 ttl=63 time=2.317 ms
```

```
VPCS> ping 2001:db8:beef:1003::1
2001:db8:beef:1003::1 icmp6_seq=1 ttl=63 time=2.719 ms
2001:db8:beef:1003::1 icmp6_seq=2 ttl=63 time=2.992 ms
```

- Run extended pings to the remote host

```
VPCS> ping 2001:db8:beef:101::11 -c 1000
2001:db8:beef:101::11 icmp6_seq=1 ttl=58 time=3.022 ms
2001:db8:beef:101::11 icmp6_seq=2 ttl=58 time=3.453 ms
```

- Validate failover when Switch1 uplink to Switch2 is shutdown

```
Switch1(config)# int 1/1/2
Switch1(config-if)# shu
```

```
VPCS> ping 2001:db8:beef:101::11 -c 1000
2001:db8:beef:101::11 icmp6_seq=1 ttl=58 time=3.022 ms
2001:db8:beef:101::11 icmp6_seq=2 ttl=58 time=3.453 ms
2001:db8:beef:101::11 icmp6_seq=3 ttl=58 time=3.703 ms
2001:db8:beef:101::11 icmp6_seq=4 ttl=58 time=4.607 ms
2001:db8:beef:101::11 icmp6_seq=5 ttl=58 time=2.979 ms
2001:db8:beef:101::11 icmp6_seq=6 ttl=58 time=3.163 ms
2001:db8:beef:101::11 icmp6_seq=7 ttl=58 time=3.297 ms
2001:db8:beef:101::11 icmp6_seq=8 ttl=58 time=2.742 ms
2001:db8:beef:101::11 icmp6_seq=9 ttl=58 time=3.546 ms
2001:db8:beef:101::11 icmp6_seq=10 ttl=58 time=3.808 ms
2001:db8:beef:101::11 icmp6_seq=11 ttl=58 time=2.963 ms
2001:db8:beef:101::11 icmp6_seq=12 ttl=58 time=3.452 ms
2001:db8:beef:101::11 icmp6_seq=13 ttl=58 time=3.239 ms
2001:db8:beef:101::11 icmp6_seq=14 timeout
2001:db8:beef:101::11 icmp6_seq=15 timeout
2001:db8:beef:101::11 icmp6_seq=16 timeout
2001:db8:beef:101::11 icmp6_seq=17 timeout
2001:db8:beef:101::11 icmp6_seq=18 timeout
2001:db8:beef:101::11 icmp6_seq=19 timeout
2001:db8:beef:101::11 icmp6_seq=20 timeout
```

```
2001:db8:beef:101::11 icmp6_seq=21 timeout
2001:db8:beef:101::11 icmp6_seq=22 timeout
2001:db8:beef:101::11 icmp6_seq=23 timeout
2001:db8:beef:101::11 icmp6_seq=24 timeout
2001:db8:beef:101::11 icmp6_seq=25 timeout
2001:db8:beef:101::11 icmp6_seq=26 timeout
2001:db8:beef:101::11 icmp6_seq=27 timeout
2001:db8:beef:101::11 icmp6_seq=28 timeout
2001:db8:beef:101::11 icmp6_seq=29 timeout
2001:db8:beef:101::11 icmp6_seq=30 timeout
2001:db8:beef:101::11 icmp6_seq=31 timeout
2001:db8:beef:101::11 icmp6_seq=32 timeout
2001:db8:beef:101::11 icmp6_seq=33 ttl=58 time=3.181 ms
2001:db8:beef:101::11 icmp6_seq=34 ttl=58 time=5.085 ms
2001:db8:beef:101::11 icmp6_seq=35 ttl=58 time=3.339 ms
2001:db8:beef:101::11 icmp6_seq=36 ttl=58 time=3.022 ms
2001:db8:beef:101::11 icmp6_seq=37 ttl=58 time=5.024 ms
```

- Unfortunately, BGP fall-over to speed up BGP neighbor detection doesn't seem to work in the simulator

```
Switch1(config)# do sh run bgp
router bgp 65001
    neighbor 2001:db8:beef:1002::1 fall-over
```

Appendix – Complete Configurations

- If you face issues during your lab, you can verify your configs with the configs listed in this section
- If configs are the same, try powering off/powering on the switches to reboot them

Switch1

```

Switch1# sh run
Current configuration:
!
!Version ArubaOS-CX Virtual.10.07.0004
!export-password: default
