Options Implementation

Vendor Class Identifier

All Aruba Access Points implement the DHCP option 60 vendor class identifier (RFC 2132) that forwards a specific string to the DHCP server in discovery and request packets. The string value that is forwarded to the DHCP server is dependent on the Aruba Access Points mode (Table 1.0):

Type	Vendor Class Identifier
Instant	ArubaInstantAP
Campus	ArubaAP
Unified	ArubaInstantAP

Table 1.0 – Vendor Class Identifiers

A DHCP server can be configured to filter on received option 60 string values and forward standard or vendor specific options in DHCP offer and acknowledgement packets. An example of this is provided in the [ISC DHCP Server](#) configuration example further in this document. Filtering using option 60 allows different types of devices that require vendor-specific information to co-exist in a common broadcast domain. For example two vendors Access Points sharing a DHCP scope that each require specific option 43 values to be supplied for Controller discovery.

Aruba Access Points also requires specific option 60 values to be returned in DHCP offer and acknowledgement packets for vendor specific information to be considered. The expected option 60 value being dependent on the mode of the Access Points. If the expected option 60 value is not present in the DHCP offer or acknowledgement packet, any supplied vendor specific information is ignored.

Vendor-Specific Information

Aruba Access Points support vendor-specific information that can be provided in offer and acknowledgement packets. The type of vendor-specific information that is supported by an Aruba Access Point is dependent on the mode. For example Instant mode Access Points can be supplied with HTTP Proxy Server and/or AirWave Server information while Campus mode or Unified Access Points can be supplied Mobility Controller information.

Aruba currently implements two option codes. Option 43 is implemented to supply Mobility Controller and AirWave Server information while option 148 is implemented to supply HTTP Proxy Server information. Examples, usage and syntax for each vendor-specific option is provided in each respective section.

As previously mentioned, for an Aruba Access Point to implement the supplied vendor-specific information, the correct option 60 string value must be returned. If the correct option 60 value is not present in the DHCP offer and acknowledgement with the vendor-specific information, the Aruba Access Point will ignore it.

Client Details

All Aruba Access Points implement a DHCP client as a means of dynamically obtaining IPv4 addressing along with other network configuration parameters. The information provided by a DHCP server is used by Aruba Access Points to provide the necessary information required to communicate over an intermediate IPv4 network, influence the Access Points mode as well as provide Mobility Controller or AirWave Server information.

Instant Mode Access Points

This section provides details for the standard and Aruba vendor-specific options supported by Aruba Access Points operating in Instant mode. Information is provided for the DHCP options supplied by Access Points to the DHCP server in discovery and request packets as well as the DHCP options that can be supplied to the Access Points in offer and request packets.

Standard Forwarded Options

Table 2.0 lists the standard options that are supplied by Instant-based Access Points to a DHCP server in discovery and request packets. The values for these options can be used by the DHCP server to assign a specific host address (i.e. static reservations) or filter and supply specific return options:

Code	Description	RFC	Notes / Example
61	Client Identifier	RFC 2132	The base MAC address of the Access Point. Example: 9c:8c:d8:ca:83:20
60	Vendor Class Identifier	RFC 2132	The option 60 value sent by Instant-based Access Points: Example: ArubaInstantAP

Table 2.0 – Forwarded Options

Table 2.1 lists the standard and vendor-specific DHCP options that are requested by Instant-based Access Points in discovery and request packets. The requested options tell the DHCP server which options are supported and can be returned to the Access Points:

Code	Description	RFC	Requested Options
55	Parameter Request List	RFC 2132	1 (Subnet Mask) 3 (Router) 6 (Domain Name Server) 12 (Host Name) 15 (Domain Name) 42 (Network Time Protocol) 43 (Vendor-Specific Information) 60 (Vendor Class Identifier) 148 (Proxy Server Information)

Table 2.1 – Requested Options

Standard Return Options

Table 2.2 lists the standard DHCP options and examples that can be returned to Instant-based Access Points from a DHCP server in offer and acknowledgement packets:

Code	Description	Format	Notes / Example
1	Subnet Mask	IP Address	The subnet mask assigned by the DHCP server. Example: 255.255.255.0
3	Router	IP Address	The default gateway assigned by the DHCP server. Example: 192.0.2.1
6	Domain Name Server	IP Address	A list of DNS servers assigned by the DHCP server (in order of preference). Example: 192.0.2.2
15	Domain Name	String	The domain name assigned by the DHCP server. Example: arubanetworks.local
42	Network Time Protocol Servers	String	IP addresses or FQDNs of one or more NTP servers. Note this will override the default pool.ntp.org servers. Example: ntp.arubanetworks.local

Table 2.2 – Standard Return Options

Vendor-Specific Return Options

Airwave Server Discovery

Table 2.3 lists the Aruba vendor-specific options, formatting and examples that can be returned to Instant-based Access Points to perform AirWave Server discovery. Note that the option 60 value **ArubaInstantAP** must be returned or the option 43 value will be ignored. Please refer to the AirWave User Guide for more details:

Code	Description	Format	Use / Example
43	Vendor-Specific Information	String	AirWave Servers Group, Folder, IP/FQDN and Shared Key. Format: Group:Top-Folder:Sub-Folder,[IP/FQDN],[Key] Example: IAPs:Branch1,192.0.2.20,Aruba123
60	Vendor Class Identifier	String	Must be supplied with option 43: Mandatory Value: ArubaInstantAP

Table 2.3 – AirWave Server Discovery

HTTP Proxy

Starting with Instant 8.4.0.0, Instant-based Access Points can be supplied with HTTP proxy configuration to permit Zero Touch Provisioning (ZTP) through a HTTP proxy server using DHCP option 148. This DHCP option can be supplied to Instant-based Access Points if Activate, AirWave or Central is reachable through a HTTP proxy server. Instant 8.5.0.0 provides an additional enhancement by adding support for username and password.

Table 2.4 lists the DHCP vendor specific options, formatting and examples to permit ZTP through a HTTP proxy server. Note that the option 60 value **ArubaInstantAP** must be returned or the option 148 value will be ignored:

Code	Description	Format	Use / Example
148	Proxy Server Information (8.4.0.0)	String	HTTP proxy server IP/FQDN and Port: Format: <i>server=[IP/FQDN],port=[Port]</i> Example: <i>server=192.0.2.30,port=8080</i>
148	Proxy Server Information (8.5.0.0)	String	HTTP proxy server IP/FQDN, Port, Username and Password: Format: <i>server=[IP/FQDN],port=[Port],username=[Value],password=[Value]</i> Example: <i>server=192.0.2.30,port=8080,username=iap1,password=aruba123</i>
60	Vendor Class Identifier	String	Must be supplied with option 148: Mandatory Value: ArubaInstantAP

Table 2.4 – HTTP Proxy Server

Please note that both the username and password are forwarded to Instant mode Access Points in offers and acknowledgements in clear text.

The HTTP Proxy option can be used with Instant mode Access Points that are managed by AirWave or Central. When managed by AirWave, the HTTP Proxy option can be combined with the [AirWave Server Discovery](#) option.

Campus Mode Access Points

This section provides details for the standard and Aruba vendor-specific options supported by Aruba Access Points operating in Campus mode terminating on Mobility Controllers. Information is provided for the DHCP options supplied by Access Points to the DHCP server in discovery and request packets as well as the DHCP options that can be supplied to the Access Points in offer and request packets.

Standard Forwarded Options

Table 3.0 lists the standard options that are supplied by Campus-based Access Points to a DHCP server in discovery and request packets. The values for these options can be used by the DHCP server to assign a specific host address (i.e. static reservations) or filter and supply specific return options:

Code	Description	RFC	Sent Option Value
61	Client Identifier	RFC 2132	The base MAC address of the Aruba Instant Access Point. Example: 9c:8c:d8:ca:83:20
60	Vendor Class Identifier	RFC 2132	The option 60 value sent by Campus-based Access Points: Example: ArubaAP

Table 3.0 – Forwarded Options

Table 3.1 lists the standard and vendor-specific DHCP options that are requested by Campus-based Access Points in discovery and request packets. The requested options tells the DHCP server which options are supported and can be returned to the Access Points:

Code	Description	RFC	Requested Options
55	Parameter Request List	RFC 2132	1 (Subnet Mask) 3 (Router) 6 (Domain Name Server) 12 (Host Name) 15 (Domain Name) 42 (Network Time Protocol) 43 (Vendor-Specific Information) 60 (Vendor Class Identifier)

Table 3.1 – Requested Options

Standard Return Options

Table 3.2 lists the standard DHCP options and examples that can be returned to Campus-based Access Points from a DHCP server in offer and acknowledgement packets:

Code	Description	Format	Notes / Example
1	Subnet Mask	IP Address	The subnet mask assigned by the DHCP server. Example: 255.255.255.0
3	Router	IP Address	The default gateway assigned by the DHCP server. Example: 192.0.2.1
6	Domain Name Server	IP Address	A list of DNS servers assigned by the DHCP server (in order of preference). Example: 192.0.2.2
15	Domain Name	String	The domain name assigned by the DHCP server. Example: arubanetworks.local

Table 3.2 – Standard Return Options

Vendor-Specific Return Options

Mobility Controller Discovery

Table 3.3 lists the Aruba vendor-specific DHCP options, formatting and examples that can be returned to Campus-based Access Points to discovery a Mobility Controller or Cluster. Note that the option 60 value **ArubaAP** must be returned or the option 43 value will be ignored:

Code	Description	Format	Use / Example
43	Vendor-Specific Information	String	Mobility Controller / Cluster IP Address. Example: 192.0.2.15
60	Vendor Class Identifier	String	Must be supplied with option 43: Mandatory Value: ArubaAP

Table 3.3 – Mobility Controller / Cluster IP

Unified Access Points

This section provides details for the Aruba vendor-specific options supported by Aruba Unified Access Points using the factory defaulted configuration. Unlike Access Points purchased as Instant or Campus models, Unified Access Points are either shipped with a special manufacturing image (early units) to facilitate the discovery process to become either an Instant mode or Campus mode Access Point or the full Instant image.

Unified Access Points follow a specific discovery process to connect to a controller-based or controller-less network. With Unified Access Points, Aruba has not introduced a new operating mode – but rather a new way for Aruba Access Points to auto-discovery their operating mode. Figure 1.0 provides a flow for this discovery process.

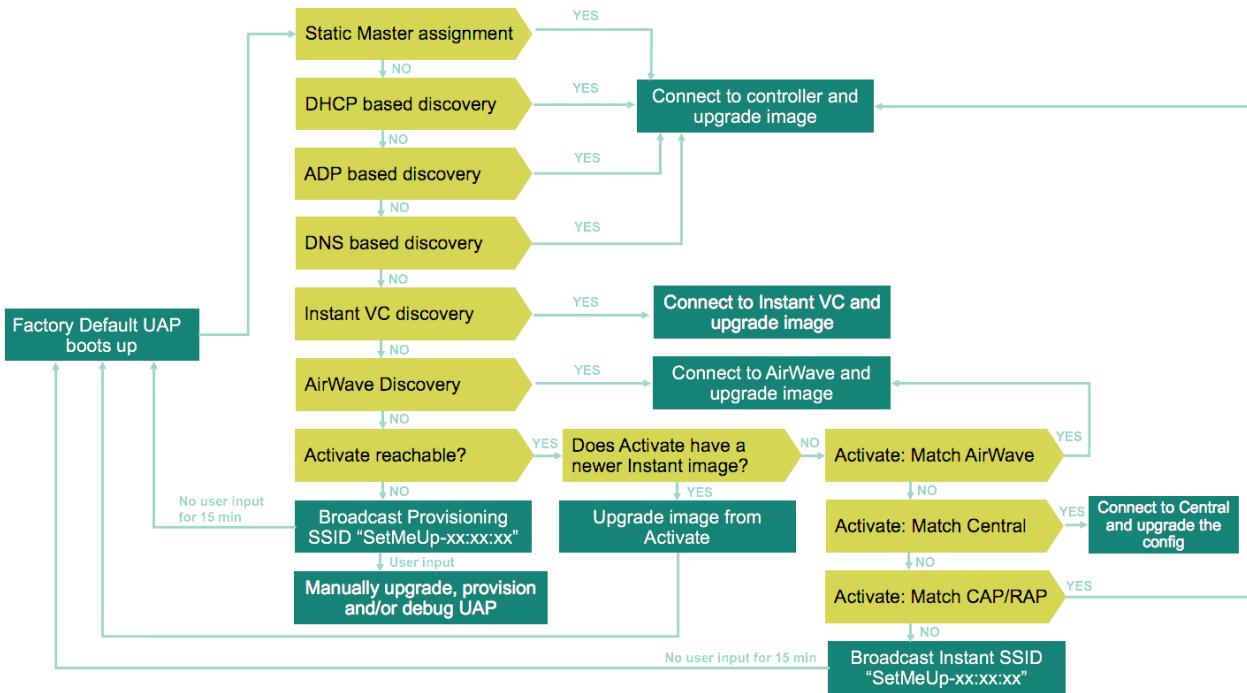

Figure 1.0 – Unified Access Point Discovery Process

When a Unified Access Point first initializes, it behaves in the same way as an Aruba Access Point operating in Instant mode. The standard and vendor-specific DHCP options that are supported mirror what has been captured in the [Instant Mode Access Points](#) section. Likewise if a Unified Access Point has been converted into Campus mode, the standard and vendor-specific DHCP options that are supported mirror what has been captured in the [Campus Mode Access Points](#) section. The operating mode determining the DHCP options that are supported.

One discovery enhancement for Unified Access Point is that vendor-specific DHCP options can be leveraged to convert the Unified Access Points into Campus mode. Unlike Access Points operating in Instant mode, vendor-specific options can be supplied to the Unified Access Point to initiate Mobility Controller discovery and the Campus mode conversion.

Campus Mode Conversion

Table 4.0 lists the Aruba vendor-specific DHCP options, formatting and examples that can be returned to a Unified Access Point to initiate Mobility Controller discovery and the Campus mode conversion. Note that the option 60 value **ArubaAP** must be returned or the option 43 value will be ignored:

Code	Description	Format	Use / Example
43	Vendor-Specific Information	String	Mobility Controller / Cluster IPv4 Address. Example: 192.0.2.15
60	Vendor Class Identifier	String	Must be supplied with option 43: Mandatory Value: ArubaAP

Table 4.0 – Unified Access Point Campus Mode Conversion

Please note that if the option 60 value **ArubaInstantAP** is returned, the Unified Access Point will follow the Instant mode discovery process.

Server Configuration Examples

This section provides contextual DHCP server configuration examples for how to correctly configure Aruba vendor-specific return options on Aruba AOS-S Switches, Aruba AOS-8 Mobility Controllers, Cisco IOS/IOS-XE Routers or Switches, Linux ISC and Microsoft Windows Server.

    option routers 192.168.77.1;
    option domain-name "lab.marshalls.local";
    pool {
        failover peer "failover-partner";
        range 192.168.77.100 192.168.77.250;
    }
    subclass "vendor-class" "ArubaAP" {
        option vendor-class-identifier "ArubaAP";
        option masterip 192.168.72.15;
    }
}
```

Unified Access Points

Campus Mode Conversion Example

DHCP Scope Example 1 – Standard Return Options

```
# Global Options
option masterip code 43 = ip-address;

# Scope Example
subnet 192.168.77.0 netmask 255.255.255.0 {
    option routers 192.168.77.1;
    option domain-name "arubanetworks.local";
    option vendor-class-identifier "ArubaAP";
    option masterip 192.168.72.15;
    pool {
        range 192.168.77.100 192.168.77.250;
    }
}
```

DHCP Scope Example 2 – Return Options by Vendor-Class

```
# Global Options
option masterip code 43 = ip-address;
class "vendor-class" {
    match option vendor-class-identifier;
}

# Scope Example
subnet 192.168.77.0 netmask 255.255.255.0 {
    option routers 192.168.77.1;
    option domain-name "lab.marshalls.local";
    pool {
        failover peer "failover-partner";
        range 192.168.77.100 192.168.77.250;
    }
    subclass "vendor-class" "ArubaInstantAP" {
        option vendor-class-identifier "ArubaAP";
        option masterip 192.168.72.15;
    }
    subclass "vendor-class" "ArubaAP" {
        option vendor-class-identifier "ArubaAP";
        option masterip 192.168.72.15;
    }
}
```

Note that in the second example, two subclasses have been defined. The first subclass matches on the option 60 value **ArubaInstantAP** and is defined to initiate the conversion of the Unified Access Points. Remember by default Unified Access Points in a factory defaulted state will send the option 60 value **ArubaInstantAP**. The second subclass matches on the option 60 value **ArubaAP** and is defined to support deployments of legacy Access Points operating in Campus mode.

Microsoft DHCP Server

The examples below demonstrate how to configure Aruba vendor-specific return options as standard options within a DHCP scope. Due to the differences on how Microsoft encapsulates pre-defined options when filtering on vendor-classes, it is not currently possible to filter on an Aruba option 60 value and return vendor-specific options to Aruba Access Points. The returned encapsulated values include type-length-value (TLV) blocks which cannot be deciphered by an Aruba Access Point.

Instant Mode Access Points

AirWave Discovery Example

Option Name	Vendor	Value
003 Router	Standard	192.168.77.1
006 DNS Servers	Standard	192.168.66.3
015 DNS Domain Name	Standard	lab.marshalls.local
043 Vendor Specific Info	Standard	49 41 50 73 3A 42 72 61 6e 63 68 31 2c 31 ...
060 Vendor Class Identifier	Standard	ArubaInstantAP

Option 43 Example

The screenshot shows the 'Scope Options' dialog with the 'General' tab selected. In the 'Available Options' list, the checkbox for '043 Vendor Specific Info' is checked and highlighted with a red box. In the 'Data entry' section, there is a table with columns 'Data', 'Binary', and 'ASCII'. The ASCII column contains the value 'IAPs:Branch1,192.168.66.120,Aruba123'. This table is also highlighted with a red box.

Option 60 Example

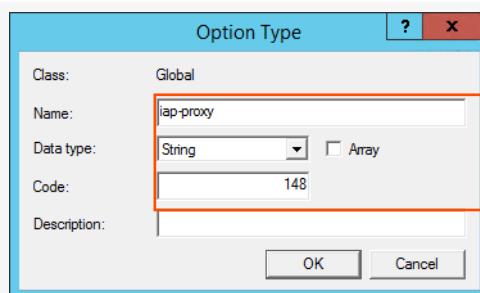

The screenshot shows the 'Scope Options' dialog with the 'General' tab selected. In the 'Available Options' list, the checkbox for '060 Vendor Class Identifier' is checked and highlighted with a red box. In the 'Data entry' section, there is a 'String value:' input field containing the value 'ArubaInstantAP', which is also highlighted with a red box.

HTTP Proxy Example

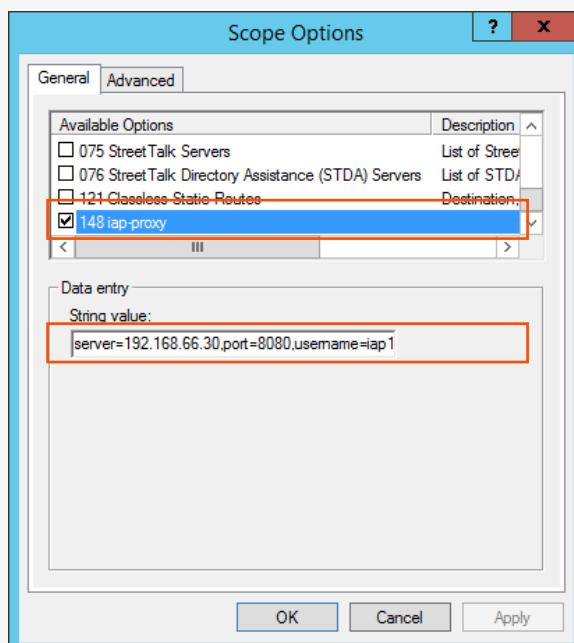

DHCP Scope Example

Option Name	Vendor	Value
003 Router	Standard	192.168.77.1
006 DNS Servers	Standard	192.168.66.3
015 DNS Domain Name	Standard	lab.marshalls.local
060 Vendor Class Identifier	Standard	ArubaInstantAP
