Executive Summary

UFS 139 is a best practice document prepared by UNINETT in co-operation with Aruba, Intelecom Group AS and the HE sector's work group for mobility, gc-mobilitet@uninett.no.

This document describes one possible way of configuring eduroam on Aruba wireless controllers and utilizing Aruba ClearPass as a RADIUS server. Configuration of both wireless controller and the ClearPass Policy Manager is shown step-by-step using screenshots and some explanatory text.

The Technical Specification has received final approval after a four-week open consultation period with the HE sector.

1 Introduction

This document is a guide to configuring eduroam, including IEEE 802.1X, in an Aruba controller-based environment – i.e. a configuration based on one or more Aruba controllers that govern the traffic to and from local or remote Aruba access points. The guide applies to Aruba 600 Series, 3000 Series, 6000 and 7200 Series Mobility controllers all running the same ArubaOS (tm). All the configuration examples are from a 3600 controller (Refer to UFS 127 for Cisco controllers).

This best practice document specifically provides instructions and advice for configuration of Aruba equipment – that is wireless controllers and ClearPass RADIUS. For network planning, physical installation of access points, configuration of FreeRADIUS or Windows NPS and details on the operation of 802.1X, refer to UFS127, UFS112 and UFS140.

The document is divided into two parts; the first is about Aruba wireless controller configuration and the second is on the configuration of ClearPass RADIUS.

It is assumed that the initial configuration (addresses, VLAN's, DNS and so on) is already in place. If you need assistance for the initial setup, please refer to the Aruba configuration guides, Validated Reference Design (VRD) or other initial guides. You will find several examples by doing a simple search.

2 Aruba Controller Configuration

This chapter is a step by step guide for configuring eduroam on an Aruba controller. The recommendations are based on information from Aruba, UNINETT and experience from implementations at different institutions in the Norwegian HE sector.

The configuration can be done via CLI or GUI.

Using either method, the following steps are needed:

1. **Create RADIUS Server(s)**

Configuration > Authentication > Servers > RADIUS Server > Add (a name for the new server must be typed in first)

2. **Create RADIUS Server Group**

Configuration > Authentication > Servers > Server Group > Add

3. **Create 802.1x Group Auth. Profile**

Configuration > Authentication > L2 Auth. > 802.1x Auth. > Add

4. **Create User Roles**

Configuration > Access Control > User Roles > Add

5. **Create AAA Profile**

Configuration > Authentication > AAA Profiles > Add

6. **Create SSID Profile**

Configuration > All Profiles > Wireless LAN > SSID Profile > Add

7. **Create Virtual AP**

Configuration > All Profiles > Wireless LAN > Virtual AP Profile > Add

Select SSID and AAA Profiles created above

Sections 2.1 and 2.2 below show examples of the above steps using GUI and CLI respectively.

2.1 GUI Details

Step 1: Configuration > Authentication > Servers > RADIUS Server > Add (a name for the new server must be typed in first).

Here, “new-radius” is added. Click Apply (bottom right in the GUI). Repeat for a second server.

RADIUS Server > new-radius		Show Reference	Save As	Reset
Host	RADIUS.server_IP			
Key	Retype: Shared secret			
Auth Port	1812			
Acct Port	1813			
Retransmits	3			
Timeout	5 sec			
NAS ID	eduroam-aruba	Optional ID for filtering		
NAS IP	IP on this controller seen by RADIUS			
Enable IPv6	<input type="checkbox"/>			
NAS IPv6				
Source Interface	vlanid			
	ipv6addr			
Use MD5	<input type="checkbox"/>			
Use IP address for calling station ID	<input type="checkbox"/>			
Mode	<input checked="" type="checkbox"/>			
Lowercase MAC addresses	<input type="checkbox"/>			
MAC address delimiter	colon	Select preferred delimiter		

Figure 2.1: Adding a RADIUS server

Note: If you do not fill in the “NAS IP” above the IP entered under “Security > Authentication > Advanced || the Radius Client “NAS IPv4 Address” will be used as the source address. In a multi-controller environment, that field is by default copied from the Master Controller, meaning that authentication on a local controller will fail as the answer back from the RADIUS server will go to the Master. In other words, the “NAS IP” must be entered on local controllers.

Step 2: Configuration > Authentication > Servers > Server Group > Add (name of server typed first – here eduroam).

Add the above-defined servers to the Server Group (order defines priority).

Security > Authentication > Servers

Servers AAA Profiles L2 Authentication L3 Authentication User Rules Advanced

Server Group > eduroam

Servers		Name	Server-Type	trim-FQDN	Match-Rule
<input type="checkbox"/>	radius01.uninett.no	Radius	No	Add servers from Step 1	
<input type="checkbox"/>	radius02.uninett.no	Radius	No		
<input type="checkbox"/>	New				
<input type="checkbox"/>	Up				
<input type="checkbox"/>	Down				
<input type="checkbox"/>	Delete				

Server Rules

Priority	Attribute	Operation	Operand	Type	Action	Value	Validated
1	Tunnel-Private-Group-Id	equals	21	String	set vlan	21	Yes

Figure 2.2: Adding a RADIUS server group

Note: It is possible (but not recommended) to use “Server Rules” to set a User role or Vlan based on a wide range of conditions – for example a RADIUS parameter. Try adding a Server Rule to see all options.

Note 2: If you have an advanced RADIUS server (Freeradius, ClearPass etc.), it is better to place rules for Vlan or Role attributes on the RADIUS server, this makes both changes, documentation and troubleshooting easier.

Step 3: Configuration > Authentication > L2 Auth. > 802.1x Auth. > Add (type name of profile before add - here eduroam)

This is just to have a separate .1x profile to reference in the AAA profile.

802.1X Authentication Profile > eduroam

Show Reference Save As Reset

Basic Advanced

Max authentication failures	0
Enforce Machine Authentication	<input type="checkbox"/>
Machine Authentication: Default Machine Role	guest

Termination	<input type="checkbox"/>
Termination EAP-Type	<input type="checkbox"/> eap-tls <input type="checkbox"/> eap-peap
Termination Inner EAP-Type	<input type="checkbox"/> eap-mschapv2 <input type="checkbox"/> eap-gtc

Figure 2.3: 802.1X authentication profile

Step 4: Configuration > Access Control > User Roles > Add (add new or edit existing)

You need to define two User Roles. One initial role (here, eduroam-logon) that block all traffic before successful authentication and a second role that is applied after authentication is completed. The Firewall policies defined under the “eduroam-authenticated” role should reflect your internal security policy (if not reflected elsewhere in your network configuration) and should also adhere to the [eduroam policy](#) (section 3.7 in Norwegian policy) stating which ports must be open as a minimum.

Security > Access Control > User Roles

User Roles	System Roles	Policies	Time Ranges	Guest Access			
Name	Firewall Policies			Bandwidth Contract	Actions

3 ClearPass RADIUS Configuration

This chapter describes how to implement eduroam using ClearPass as an AAA RADIUS server. The recommendations are based on information from Aruba, UNINETT and experience from implementations at different institutions in the Norwegian HE sector. The following guide assumes you already have a local authentication source defined on ClearPass and have a Radius server certificate in place. If this is not the case, please first refer to [Appendix A](#) for information on how to use Windows AD as an authentication source and [Appendix B](#) to install a server certificate on ClearPass. The local authentication source could be local user accounts or a connection to an LDAP server.

Before proceeding with the configuration, some planning and preparation is needed:

- If you are not already an eduroam Service Provider (SP) or Identity Provider (IdP), read the [\[Join\]](#) information on the Norwegian eduroam website. It describes what is required to become an SP or IdP in Norway. Alternatively, contact your NRO/NREN for details on how to become an eduroam provider.
- Verify which external IP-address(es) your ClearPass will use when communicating with the national proxy servers. Allow RADIUS AAA traffic to pass to this address, incoming with destination UDP 1812/1813 for IdP and answers with source UDP 1812/1813 for SP.
- Decide in which vlan and/or role you want to place eduroam users, and whether you want different vlan/roles for guests, students and staff. The recommendation is to use a guest vlan/role as default (configured on the controller) and have RADIUS (ClearPass) return a different vlan/role for students and staff when on their own premises. The vlan/role shall not be returned for own users while roaming.

The following steps are needed to setup ClearPass

1. Create Authentication sources (proxy targets) for the national servers (for SP)
2. Create Devices for all Wireless Controllers (SP and IdP) and national proxy servers (IdP)
3. Create Devices Groups for local controllers (SP and IdP) and national proxies (IdP)
4. Create “eduroam-local” service - local authentication, for local clients (IdP)
5. Create “eduroam-inbound” service - local authentication, for own roammers (IdP)
6. Create “eduroam-outbound” service for visitors (SP)

Section 3.1 below shows details of these 6 steps.

3.1 Configuration Details

Step 1: Configuration > Authentication > Sources – “Add”

Here you define the national proxies with shared secrets obtained from your NRO (National Roaming Operator). These sources (primary and backup) are used for proxy authentication requests from visiting eduroam users. We recommend using Authentication sources for this purpose to be able to set the Operator-Name attribute pre-proxy (this is not possible using “Proxy Targets” under Network).

Configuration » Authentication » Sources » Add - National proxies

Authentication Sources - National proxies

Summary	General	Primary	Attributes	Backup 1

Port:	1812			
Secret:	*****			
Backup 1:				
Server Name:	ntlr1.eduroam.no			
Port:	1812			
Secret:	*****			
Attributes:				
RADIUS Pre Proxy Attributes:				
Type	Name	Value		
1. Radius:IETF	Operator-Name	=	1testing.no	
RADIUS Post Proxy Attributes:				

Figure 3.1: Defining national proxy targets

Note: Replace “1testing.no” with your realm “1<realm>.tld”.

Step 2: Configuration > Network > Devices > Add

Here you define the clients that are allowed to send requests to this radius server. This is all national proxy servers and your own wireless controllers (or AP's). Enable RADIUS CoA (Change of Authority) for your own controllers but not for the national proxies. Allow the CoA port (default UDP 3799) to controllers. Set the correct Vendor Name for your controllers and use the IETF setting for national proxies. See example in following figure.

Description:	National eduroam proxies
Format:	<input type="radio"/> Subnet <input type="radio"/> Regular Expression <input checked="" type="radio"/> List
List:	<div style="display: flex; align-items: center;"> <div style="flex: 1;"> <p>Available Devices -</p> <input style="width: 100%; height: 150px; border: 1px solid #ccc; margin-bottom: 5px;" type="text"/> <p>Filter</p> </div> <div style="margin-right: 20px;"> <p>Selected Devices -</p> <input style="width: 100%; height: 150px; border: 1px solid #ccc; margin-bottom: 5px;" type="text"/> <p>Filter</p> </div> <div style="flex: 1; text-align: center;"> <p>>></p> <p><<</p> </div> </div>
<input type="button" value="Copy"/> <input type="button" value="Save"/> <input type="button" value="Cancel"/>	

Figure 3.3: Defining network device groups

The local controllers device group should contain all your controllers defined in Step 2, and likewise all/both national proxies in the eduroam proxies group.

Step 4: Configuration > Services > Add (eduroam-local)

This service definition will authenticate local on-premises users. It is only needed if you are an IdP. This assumes you already have AD (or some other authentication source added to ClearPass), if this is not the case, please refer to [Appendix A](#).

Eduroam users are by default placed in a VLAN as configured on your controller(s). It is in this service, under the “Enforcement” and “Roles” tabs, that you can change what local users are allowed to access by either placing them in a different vlan or assigning them to different roles.

Select type “802.1X Wireless” and enter the service name “eduroam-local” in the Service Tab.

Then “Click to add” service rules, so that you get:

Configuration » Services » Edit - eduroam-local

4. Connection	Src-IP-Address	BELONGS_TO_GROUP	Local controllers	
5. Click to add...				

Note: Regex for Full-Username here “.*@.*ad\.eduroam\.no\$”. Substitute ad.eduroam.no with your realm name.

Figure 3.4: Defining the eduroam-local service

In the Authentication Tab, select your AD as authentication source and the methods you support). See [Appendix A](#) for defining your AD as source. Below only PEAP is selected as an authentication method, some might choose EAP-TTLS (due to password format) or EAP-TLS for client certificate authentication.

Configuration » Services » Edit - eduroam-local

Services - eduroam-local

Summary	Service	Authentication	Roles	Enforcement
		[EAP PEAP] <input type="button" value="Move Up"/> <input type="button" value="Move Down"/> <input type="button" value="Remove"/> <input type="button" value="View Details"/> <input type="button" value="Modify"/> --Select to Add--		Add new Authentication
		Authentication Sources: tomy-win.ad.eduroam.no [Active Directory] <input type="button" value="Move Up"/> <input type="button" value="Move Down"/> <input type="button" value="Remove"/> <input type="button" value="View Details"/> <input type="button" value="Modify"/> --Select to Add--		Add new Authentication
		Strip Username Rules: <input checked="" type="checkbox"/> Enable to specify a comma-separated list of rules to strip username prefixes or suffixes user:@ If username precedes domain name, use user:<separator> (e.g., user:@) Otherwise, use <separator>:user (e.g., \:user)		

Figure 3.5 Add an authentication source to the eduroam-local service

Under the Roles Tab, you can assign roles that can be used in enforcement profiles to assign a vlan or other attributes to clients. There is a lot of flexibility in how this can be used.

The three figures below show how Group Membership in an AD is translated to a Role in ClearPass and that Role used to assign a VLAN through an Enforcement Profile. This is included as an example and is not the most practical solution, but does show the functionality. Examples of more straightforward methods to achieve similar results could be:

- Use the Aruba-User-Vlan attribute (instead of the Tunnel-Private-Group-ID), then an Aruba controller will accept the VLAN setting without additional configuration on the controller.
- Use Aruba-Named-Vlan attribute to set a VLAN pool that is defined on the controller. This will be beneficial for large user groups and / or fragmented ipv4 address ranges.
- Use Aruba-User-Role attribute to assign users into different “authenticated roles” on the controller and simply let all users use the default assigned VLAN pool from controller. I.e. let the controller define what the user is allowed and not the access-lists or firewall of the different subnets.

1. Radius:IETF	Termination-Action	= RADIUS-Request (1)
2. Radius:IETF	Tunnel-Type	= VLAN (13)
3. Radius:IETF	Tunnel-Medium-Type	= IEEE-802 (6)
4. Radius:IETF	Tunnel-Private-Group-Id	= 21

Figure 3.8 Example enforcement profile referenced from Fig 3.7

Step 5: Configuration > Services > Add (eduroam-inbound)

This service will be triggered when own users connect to the eduroam service from other locations. You will use the same authentication source as the above service, but no roles/vlan/attributes are written back in the reply.

Configuration » Services » Edit ~ eduroam-inbound

Services - eduroam-inbound

Summary	Service	Authentication	Roles	Enforcement
Service:				
Name:	eduroam-inbound			
Description:	802.1X Wireless Access Service			
Type:	802.1X Wireless			
Status:	Enabled			
Monitor Mode:	Disabled			
More Options:	-			
Service Rule				
Match ALL of the following conditions:				
Type	Name	Operator	Value	
1. Radius:IETF	NAS-Port-Type	EQUALS	Wireless-802.11 (19)	
2. Connection	Src-IP-Address	BELONGS_TO_GROUP	eduroam proxies	
3. Authentication	Full-Username	MATCHES_REGEX	.*@.*ad\.eduroam\.no	
Authentication:				
Authentication Methods:	EAP-PEAP eduroam			
Authentication Sources:	tomy-win.ad.eduroam.no			
Strip Username Rules:	user:@			
Roles:				
Role Mapping Policy:	-			
Enforcement:				
Use Cached Results:	Disabled			
Enforcement Policy:	[Sample Allow Access Policy]			

Figure 3.9 The eduroam-inbound service

Step 6: Configuration > Services > Add (eduroam-outbound)

Create a new service of the type “RADIUS Enforcement (Generic)” to allow eduroam visitors to logon to your eduroam SSID, authenticating at their own institution.

In the following example, the Roles and Enforcement tabs are left unchanged, this can be adjusted according to your local preferences. The service is triggered by a username containing @ coming from a local controller, which means that is has to be ordered below the eduroam-local service.

Configuration » Services » Edit - eduroam-outbound

Services - eduroam-outbound

Summary	Service	Authentication	Roles	Enforcement
Service:				
Name:	eduroam-outbound			
Description:	Adding Operator Name attribute pre-proxy			
Type:	RADIUS Enforcement (Generic)			
Status:	Enabled			
Monitor Mode:	Disabled			
More Options:	-			
Service Rule				
Match ALL of the following conditions:				
Type	Name	Operator	Value	
1. Authentication	Full-Username	CONTAINS	@	
2. Radius:IETF	NAS-IP-Address	BELONGS_TO_GROUP	Local controllers	
Authentication:				
Authentication Methods:	[EAP PEAP]			
Authentication Sources:	National proxies			
Strip Username Rules:	-			
Roles:				
Role Mapping Policy:	[Guest Roles]			
Enforcement:				
Use Cached Results:	Disabled			
Enforcement Policy:	[Sample Allow Access Policy]			

Figure 3.10 The eduroam-outbound service

Note: In the example above, the Roles and Enforcement tabs are left with the default values. Enforcement could be used to overwrite any Vlan attributes contained in a reply from the remote Radius server. The reply should not contain such attributes, i.e. this would be an extra precaution. In such an Enforcement profile, you would need to overwrite your default Vlan for eduroam visitors.

Finally check that the defined Services are ordered correctly, as seen in following figure:

Services

 Add
 Import
 Export All

#	<input type="checkbox"/>	Order ▲	Name	Type	Template	Status
1.	<input type="checkbox"/>	1	[Policy Manager Admin Network Login Service]	TACACS	TACACS+ Enforcement	
2.	<input type="checkbox"/>	2	[AirGroup Authorization Service]	RADIUS	RADIUS Enforcement (Generic)	
3.	<input type="checkbox"/>	3	[Aruba Device Access Service]	TACACS	TACACS+ Enforcement	
4.	<input type="checkbox"/>	4	[Guest Operator Logins]	Application	Aruba Application Authentication	
5.	<input type="checkbox"/>	5	eduroam-local	RADIUS	802.1X Wireless	
6.	<input type="checkbox"/>	6	eduroam-inbound	RADIUS	802.1X Wireless	
7.	<input type="checkbox"/>	7	eduroam-outbound	RADIUS	RADIUS Enforcement (Generic)	

Figure 3.11 Defined services in the correct order

4 Conclusions

Combining Aruba wireless controllers and the ClearPass Policy Manager as a RADIUS server to provide the eduroam service is a fairly easy. ClearPass can also be used as a RADIUS in combination with controllers from other wireless product vendors. You get the same functionality (if not more) using a FreeRADIUS server.

The strengths of ClearPass are the user-friendly interface for configuration, monitoring and troubleshooting, combined with the ability to differentiate access based on client type and integration with Windows AD for authentication and authorization.

The drawbacks of course are that it is not freeware and, for some, the missing / limited CLI interface.

Appendix A Active Directory Integration

This appendix describes how to configure ClearPass to use Microsoft Active Directory as an authentication source. First, ClearPass must join the AD domain, then the authentication source can be added.

A.1 Joining ClearPass to an AD Domain

Joining AD is a simple operation, but before proceeding please note the following:

- Joining AD is only needed when performing EAP-PEAP authentication (so needed for eduroam)
- Ensure NTP synchronization is enabled on all servers
- The Active Directory account used by ClearPass to join the domain requires privileges to add computers to the domain, the account is not stored by CP and can be disabled or even deleted once the join operation is completed.
- Configure ClearPass to send DNS requests to the AD server
- Use the fully qualified domain name of the AD domain controller during join (just the domain name or IP might fail)
- When entering the username (if different from Administrator), use the format: `username@domain`
- Avoid using a dash (-) in the NetBIOS Name. It has been seen to cause AD join failure.

To join AD via GUI:

Go to: Administration > Server Manager > Server Configuration > Click the server, then “Join AD Domain”

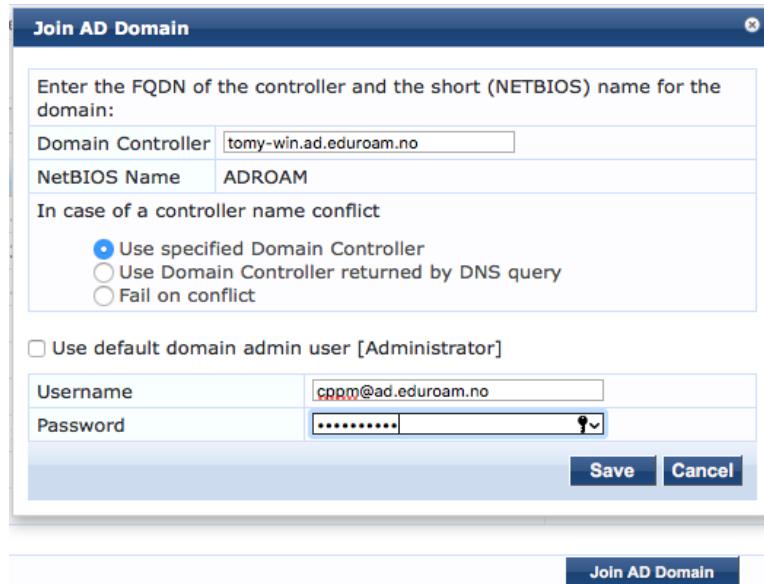

Figure A.1: Joining AD example

Alternatively, via CLI and the “appadmin” user, using “ad testjoin” to check or “ad netjoin”.

```
[appadmin@cppm-eval]# ad testjoin ADROAM
```

Join is OK

```
netjoin <domain-controller.domain-name> [domain NETBIOS name] [domain REALM name]  
[ou=<object container>]
```

A.2 Add AD as an Authentication Source

In CP; Configuration > Authentication > Sources > Add, then fill in according to the following figures.

Use a secure connection when possible.

Authentication Sources - tomy-win.ad.eduroam.no

Summary	General	Primary	Attributes
Name:	tomy-win.ad.eduroam.no		
Description:	Authentication test AD/LDAP		
Type:	Active Directory		
Use for Authorization:	<input checked="" type="checkbox"/> Enable to use this Authentication Source to also fetch role m		
Authorization Sources:	<input type="button" value="Remove"/> <input type="button" value="View Details"/> -- Select --		
Server Timeout:	10	seconds	
Cache Timeout:	36000	seconds	
Backup Servers Priority:	<input type="button" value="Move Up"/> <input type="button" value="Move Down"/> <input type="button" value="Add Backup"/> <input type="button" value="Remove"/>		

Figure A.2: Adding a source – general parameters

Authentication Sources - tomy-win.ad.eduroam.no

Summary	General	Primary	Attributes
Connection Details Hostname: tomy-win.ad.eduroam.no Connection Security: None Port: 389 (For secure connection, use 636) Verify Server Certificate: <input type="checkbox"/> Enable to verify Server Certificate for secure connection Bind DN: ppm@ad.eduroam.no (e.g. administrator@example.com OR cn=administrator,cn=users,dc=example,dc=com) Bind Password: NetBIOS Domain Name: ADROAM Base DN: cn=users,dc=ad,dc=eduroam,dc=no <input type="button" value="Search Base Dn"/> Search Scope: SubTree Search LDAP Referrals: <input type="checkbox"/> Follow referrals Bind User: <input checked="" type="checkbox"/> Allow bind using user password User Certificate : userCertificate Always use NETBIOS name: <input type="checkbox"/> Enable to always use NETBIOS name instead of the domain part in username for authentication			

Figure A.3: Adding a source - Primary Tab

Appendix B Radius (ClearPass) Server Certificate

The Radius server needs a certificate (to establish a secure connection and for clients to verify the correct home server). This certificate can be issued by a local (own) CA, through Geant or any commercial CA, as for any eduroam installation. For eduroam certificate considerations, please see “EAP Server Certificate Considerations” on the GEANT Wiki pages [\[EAP\]](#).

ClearPass have the option of separate certificates for the https server and the radius server, so having a self-signed Radius certificate is an option (the https certificate must of course be from a well-known CA to work effectively).

Go to Administration > Certificates > Server Certificate, Select Type (Radius Server Certificate) and choose from the top left options.

Administration > Certificates > Server Certificate

Server Certificate

Select Server: **cppm-eval** Select Type: **RADIUS Server Certificate**

Create Self-Signed Certificate
Create Certificate Signing Request
Import Server Certificate
Export Server Certificate

Figure B.1: Example of Self-signed Certificate

You can “Create Self-Signed Certificate”, or “Create Certificate Signing Request” – send it to your preferred CA and then “Import Server Certificate” when the certificate comes back. Creating a Certificate Signing Request will prompt you for the necessary input (see the following figure) and produce a private key and CSR. You will need the private key file and password when eventually importing the certificate into ClearPass. It is therefore important to choose “Download” to have the private key when later installing the certificate (you will not be able to get it later without a new CSR).

Create Certificate Signing Request

Common Name (CN):	cppm-eval
Organization (O):	
Organizational Unit (OU):	
Location (L):	
State (ST):	
Country (C):	
Subject Alternate Name (SAN):	
Private Key Password:	
Verify Private Key Password:	
Private Key Type:	2048-bit RSA
Digest Algorithm:	SHA-512
<input type="button" value="Submit"/> <input type="button" value="Cancel"/>	

Figure B.2: Creating a Certificate Signing Request

Before importing the final server certificate received from your chosen CA, you need to import (and enable) the Root and Intermediate CA's under Administration > Certificates > Trust List.

Whatever certificate (private or public) you choose, you will need at least the CA certificate (many operators also include intermediates) to configure the eduroam clients. The recommended way is to use CAT (eduroam's Configuration Assistant Tool) to distribute the correct settings including the CA certificate to all the clients at your institution. For more information on setting up eduroam client profiles, please see "A Guide to eduroam CAT for Institution Administrators" [\[CAT\]](#).
