Notes 65
The OmniAccess AP60/61 Installation Guide (also known as the AP 60/61) is part of a comprehensive wireless network solution. The device works in conjunction with the Alcatel Wireless LAN Switch and can act as a wireless access point or air monitor.

As a wireless Access Point (AP), the OmniAccess AP60/61 Installation Guide provides transparent, secure, high-speed data communications between wireless network devices (fixed, portable, or mobile computers with IEEE 802.11a or IEEE 802.11b/g wireless adapters) and the wired LAN.

As a wireless Air Monitor (AM), a feature unique to Alcatel products, the OmniAccess AP60/61 Installation Guide enhances wireless networks by collecting statistics, monitoring traffic, detecting intrusions, enforcing security policies, balancing wireless traffic load, self-healing coverage gaps, and more.

**NOTE**—Installing the Alcatel 60/61 requires setting the antenna power, which requires professional training. The Alcatel 60/61 installer must be trained to perform this configuration.
Front View

FIGURE 1-1 OmniAccess AP60/61 Installation Guide Front View
Antenna fixtures for Wireless Communications

Depending on the model, the AP will have one of the following:

A. Alcatel AP60—Two Reverse Polarity SMA (RP-SMA) connectors for attaching separate antennas (not included). For details, see “Alcatel 60 Detachable Antennas” on page 26. (The AP60 requires that both connectors be used in AOS-W 2.2 releases or lower. Single antenna operation is supported with AOS-W 2.3 or higher.)

**NOTE**—When facing the AP60 as shown in Figure 1-1, the antenna connector on the right is for antenna 1, and the connector on the left is for antenna 2 in a diversity configuration.

B. Alcatel AP61—Built-in swivel array with dual, tri-band, omnidirectional antennas

Indicator LEDs

During operation, the OmniAccess AP60/61 Installation Guide LEDs provide the following information:

<table>
<thead>

</tbody>
</table>

**NOTE**—LEDs on the Alcatel Wireless LAN Switch provide additional status and security information about connected APs. See the *Alcatel AOS-W User Guide* for more information.
3 Air Vents

These vents promote proper air circulation for cooling the device. Do not allow these vents to be obstructed by mounting equipment, network cables, or any other material.

4 FE Port

This port attaches the OmniAccess AP60/61 Installation Guide to a 10Base-T/100Base-TX (twisted-pair) Ethernet LAN segment. This port also supports Serial and Power Over Ethernet (SPOE).

See Appendix A for port and cable specifications.
DC Power Socket

This socket is used to connect the optional AC power adapter (not included). If POE is being used to supply power to the OmniAccess AP60/61 Installation Guide, the power adapter is not necessary.

Back View

![Back View Diagram]

**FIGURE 1-2** OmniAccess AP60/61 Installation Guide Back View
Mounting Slots

The keyhole-shaped slots on the back of the chassis are used for mounting the OmniAccess AP60/61 Installation Guide.

Air Vents

These vents promote proper air circulation for cooling the device. Do not allow these vents to be obstructed by mounting equipment, network cables, or any other material.

Fold-Out Stand

This fold-out stand allows the OmniAccess AP60/61 Installation Guide to be stood upright on a table or shelf.

Kensington Security Slot

This slot is compatible with a Kensington MicroSaver Security Cable (not included) which can be used to prevent the unauthorized removal of the OmniAccess AP60/61 Installation Guide from its installed location. To secure the OmniAccess AP60/61 Installation Guide, wrap a security cable around an immovable object, insert the cable’s lock into the Kensington Security Slot, and turn the key.

NOTE—The serial number and model number are on the bottom of the unit.
The Alcatel AP Setup Process

Setting up an Alcatel AP typically consists of four stages:

1. Wireless LAN Planning—The administrator determines how many Alcatel APs will be needed for their wireless network strategy and where they will be deployed. This can be easily accomplished using Alcatel’s automated RF Plan site-survey software (available separately).

2. AP Provisioning—Provisioning provides each Alcatel AP with initial settings that allow it to locate the host Alcatel Wireless LAN Switch. Depending on the network topology and services, AP provisioning can be performed manually for each AP or plug-and-play for batches of APs.

   AP provisioning is discussed in Chapter 2.

3. AP Deployment—Once provisioned, the AP can be physically installed at its intended place of operation.

   AP deployment is covered in Chapter 3.

4. AP Configuration—The administrator defines the operational behavior for each Alcatel AP, such as RF characteristics and security features.

   For AP configuration information, refer to the Alcatel AOS-W User Guide.
CHAPTER 2  
Provisioning Access Points

Access Points are radio broadcast devices and as such are subject to governmental regulation. Network administrators responsible for the configuration and operation of Access Points must comply with local broadcast regulations. Specifically, Access Points must use channel assignment and antenna gain settings (for detachable antennas) appropriate to the location in which the Access Point will be used. Alcatel Networks, in compliance with governmental requirements, has designed the AP60 and AP61 such that only authorized network administrators can change these settings. For more information on Access Point configuration, refer to the *AOS-W User Guide*.

Provisioning provides the AP with initial network settings that allow it to locate the host Alcatel Wireless LAN Switch. The following provisioning methods (listed in the order of preference recommended by Alcatel Networks) are available:

- **Plug and Play**—Also known as the Alcatel Discovery Protocol. This is the easiest method for AP provisioning. With plug and play, Alcatel APs can be connected to the network and brought into operation automatically. Although plug and play requires no manual intervention for the APs, this method does require specific services to be configured on your network in advance.

- **AP Provisioning**—Using this AP programming mode, AP configuration parameters are defined on the Wireless LAN switch (using the CLI or Web interface) and then uploaded to the APs. This method can be used for adding Alcatel APs to a highly customized network, or greatly simplified for the most common provisioning.
Manual Provisioning—APs can be individually provisioned using a serial console terminal connected to the AP. Although this method is complex and requires considerable care, manual provisioning can be used in almost any scenario, with or without access to the Wireless LAN switch.

NOTE—Manual provisioning is intended for use when no Alcatel Wireless LAN Switch is available, and is not generally recommended as the primary method of AP provisioning. Plug and play or AP programming mode are the preferred provisioning methods.

Each of these three methods is explained in the following sections. Use these procedures for initial provisioning of APs. To change the configuration for APs that have already been provisioned, go to Maintenance > Program AP > Re-Provision. See the AOS-W User Guide for more information on reprovisioning existing APs.

CAUTION—When an AP60 powers up for the first time, the Wireless LAN switch will recognize that it is detachable-antennas capable. The network administrator must set the antenna gain manually before the AP60 can function as an Access Point. Until the antenna gain is set, the AP60 with detachable antennas will function as an Air Monitor but will not process wireless packets as an Access Point. Refer to the AOS-W User Guide for instructions on manually setting antenna gain.

Alcatel Discovery Protocol

Alcatel Discovery Protocol (ADP) is a plug and play provisioning tool for AP60/61 Access Points. ADP performs two tasks:

- Obtains the IP address of the TFTP server from which it downloads the AP boot image
- It discovers the IP address of the master Alcatel Wireless LAN switch in the network from which the AP can download its configuration.

The address of the TFTP server that ADP discovers is the equivalent of the BOOTROM environment variable \textit{serverip}. The IP address of the Alcatel master switch is the equivalent of the environment variable \textit{master}.

ADP can discover these values using DHCP or by discovery. In the case of DHCP, ADP relies on a DHCP server which is configured to return the IP address of the Master switch using the Vendor Specific Options in DHCP. To facilitate ADP, Alcatel APs include this Vendor Specific Option in the requested Option list, and if the DHCP server is configured to return the IP address of the Master switch, the IP address will be a part of the DHCP response. This is used by the AP to get its image as well as its configuration.
Discovery of the `serverip` and `master` variables is necessary when the DHCP response does not include the Vendor Specific option. The AP attempts to discover an Alcatel Master switch by sending multicast packets and broadcast packets on its subnet. To use the ADP discovery method, the ADP discovery mechanism needs to be enabled on the Alcatel Master Switch (using the `adp discovery enable` command).

If multicast routing is enabled in the IP network between the AP and the Master switch (which can be any one or more Alcatel Wireless LAN switches in the network), the IGMP-Join option should be enabled on the Alcatel Wireless LAN switch (using the `adp igmp-join enable` command). If multicast routing is not enabled on the network, the Alcatel Wireless LAN switches need to be on the same broadcast domain as the AP or an “IP Helper” must be configured to direct the broadcast ADP packets to the Alcatel Wireless LAN switch.

Once these discovery prerequisites are met, the switch will respond to APs with the IP address of the Master Alcatel switch. The APs can then obtain their image and configuration.

To enable ADP on an Alcatel Wireless LAN switch, enter:

```
(6000) (config) #adp discovery enable
```

To enable IGMP-Join on an ADP multicast group on an Alcatel Wireless LAN switch, enter:

```
(6000) (config) #adp igmp-join enable
```

**NOTE**—If you have location-specific configurations for your Access Points, you will need to apply this configuration information using AP Reprovisioning. Refer to the *AOS-W User Guide* for details on AP Reprovisioning and see the feature description below.

**AP Reprovisioning**

AP Reprovisioning is the process by which APs are assigned, for example, location codes. Location codes are important for recalibration and triangulation. For details on AP Reprovisioning, see the *AOS-W User Guide*. 
AP Provisioning

AP Provisioning is useful for brand new APs with default configurations. To perform AP Provisioning from the GUI:

1. Go to **Maintenance > Program AP**.
   
   On this window, there are two tabs: **Provisioning** and **Reprovisioning**. The Provisioning tab is selected by default.

![FIGURE 2-1 Provisioning Tab](image)

2. Configure the APs **Subnet** and **Netmask**.
   
   This is the subnet from which the AP gets an IP during provisioning. (This is not the IP address the AP will use when deployed.)

3. Select the **Port** or Port range for provisioning.
   
   To set the Port Range, select the first and the last ports of your range. All the ports in between are automatically selected. (Ports have to be sequentially assigned.)

4. Enter the required information and click **Enable**. The Port Range screen displays.
5 Specify the Alcatel 60/61-specific parameters.

Configure the gain value appropriate for the location in which this AP will be deployed. (See Table 3-1 for appropriate antenna gain values.)

**NOTE**—If the AP being provisioned is a model with detachable antenna capability (such as an Alcatel AP-60) enter the antenna gain in dBi, for example 4.0. This is mandatory for all detachable antenna models as the AP will not bring up its radio interface or function as an AP without it.

Complete specifying Master Discovery and IP Settings and click **Apply**.

6 Plug the AP into one of the ports configured for provisioning.

If your AP is already plugged into the port, unplug it and plug it in again.

If AP is connected through POE, enter (in interface mode) **no poe** followed by **poe**.

The AP will come up with an IP from the provisioning subnet

After the AP comes up it should be in the provisioning list. Provisioning list shows the list of APs which are plugged into the provisioning ports.
7 The Clear Table button appears after an entry in the list appears. To erase all the table entries, click Clear Table. (You cannot clear selected entries.) If a number of APs are provisioned and you click Clear Table, only the entries which come up afterwards can be provisioned.

If the entry does not show up in the AP list, check network connectivity. Go to the AP console and verify if the AP has come up with the IP from the provisioning subnet.

8 After the entry shows up on the page, configure the location, Host IP/Name, Master IP address.

If AP is going to be assigned a static IP, click Use the following IP Address and enter the IP address, Netmask, Gateway IP.

If the AP is going to obtain an IP address using DHCP, click Use IP Address Using DHCP.

9 After configuring the required parameters, select the entry from the list (AP to which the configuration has to be applied) and click Apply.

The State field changes from U (Unprovisioned) to In Progress, to P (Provisioned).

NOTE—Check that the configured parameters are reflected in the AP list entry.

NOTE—Alcatel Networks recommends that you provision each AP for a unique location as suggested by site-survey planning. Label each AP with this location information and place the AP in its proper location. Failure to place APs in the location for which they were provisioned will reduce the effectiveness of such RF features as triangulation.

10 Click Back to return to the previous page.

We can see that the Subnet is still configured and Port/s are selected.

11 When finished provisioning APs, click Disable to disable AP Provisioning.

NOTE—Disable AP Provisioning after all the required APs are provisioned. Ports that are enabled for provisioning do not handle traffic. Therefore plugging an already provisioned AP into a port still set to provisioning mode will prevent that AP from functioning.

Now the AP is configured with the Parameters given.

12 Reboot the AP so the AP will come up with the new configured parameters.

Use the Reprovisioning tab for APs which are already deployed but need to be reconfigured. See the AOS-W User Guide for information on reprovisioning.
Manual Provisioning

Requirements

- A console terminal (or workstation with terminal emulation software) with an available serial communications port using a DB-9 male connector.

- An Alcatel serial breakout adapter kit, Part Number CA-SPOE-ADAPT-3, (not included). (See “Connecting the Console Terminal” on page 16.)

- Access to the OmniAccess AP60/61 Installation Guide FE port through one of the following:
  - Direct contact with the AP, or
  - If the AP is already deployed, you must have access to the end of the FE cable that leads directly to the AP with no intervening hubs, routers, or other networking equipment.
    The cable must be an 8-conductor, Category 5 UTP, straight-through FE cable with RJ-45 connectors.

- A power source for the OmniAccess AP60/61 Installation Guide. Use one of the following:
  - An optional AC power adapter (not included) and an AC power outlet rated at 100~240 V, 50~60 Hz, or
  - The OmniAccess AP60/61 Installation Guide FE port connected to an Alcatel OmniAccess 4308, OmniAccess 4324, or OmniAccess 6000 Wireless LAN switch that supports IEEE 802.3af Power Over Ethernet (POE) via a 4- or 8-conductor, Category 5 UTP, straight-through FE cable.¹

**Note**—Only IEEE 802.3af Power Over Ethernet is supported for manual provisioning. “Inline” or “midspan” POE devices require Alcatel serial breakout adapter, Part Number CA-SPOE-ADAPT-4.

¹IEEE 802.3af-complaint devices like the AP60 and AP61 use the same wire pairs for data versus for power. Within the 802.3af standard, there are two sub-specifications on how wire pairs are assigned. Alcatel conforms to 802.3af, subparagraph a. If your POE installation uses all-Alcatel equipment, you are assured proper operation. However, if you use non-Alcatel POE equipment, make sure it conforms to the same standard that Alcatel uses. Using POE equipment using IEEE 802.3af subparagraph b wiring assignments, or POE equipment not conforming to the 803.2af standard may result in damaged equipment.
Connecting the Console Terminal

Manual provisioning requires this procedure. You must use the serial console breakout adapter cable to be able to access the serial console interface to the AP60/61 while allowing the device to be powered by the AC adapter or POE (from an Alcatel Wireless LAN switch).

NOTE—The LAN connections are optional unless POE is used to power the AP.

Console Access to the AP

Figure 2-3 OmniAccess AP60/61 Installation Guide Console Topologies

Figure 2-4 Connecting Directly to the AP
1 Connect the adapter’s “To AP” RJ-45 connector to the OmniAccess AP60/61 Installation Guide FE Port.

2 Connect the adapter’s DB-9 connector to the serial port on the console terminal.

3 Connect the adapter’s “To Network” RJ-45 connector to the LAN.

The LAN connection is optional unless POE is being used to power the AP. For convenience, the adapter kit includes an FE coupler to connect RJ-45 cable ends together.

4 Connect power to the OmniAccess AP60/61 Installation Guide.

---

**CAUTION**—Be sure to comply with electrical grounding standards during all phases of installation and operation of the AP. Do not allow the OmniAccess AP60/61 Installation Guide or optional power adapter (if used) to be connected to or make contact with metal or power outlets on a different electrical ground than the device to which it is connected. Also, never connect the AP to external storm grounding sources.

---

The OmniAccess AP60/61 Installation Guide can receive electrical power using the following options:

- **POE**—If connecting the OmniAccess AP60/61 Installation Guide to a device that supplies IEEE 802.3af compliant POE, no additional power connection is necessary.

- **Power Outlet**

  **NOTE**—When the OmniAccess AP60/61 Installation Guide is installed in an air-handling space, as described in NEC (2002) Article 300.22(C), POE must be used instead of a power outlet.

  If local regulations and practices permit, connect the optional AC power adapter (not included) to the DC power socket on the rear panel of the OmniAccess AP60/61 Installation Guide and plug it into an appropriate power outlet.

  **CAUTION**—To prevent personal injury or damage to equipment, use only the AC power adapter certified for this device in the country where it is used.

  **NOTE**—The indicator LEDs on the OmniAccess AP60/61 Installation Guide will remain dark during this procedure.
5. Set your local terminal to use the following communications:

**TABLE 2-1** Console Terminal Settings

<table>
<thead>
<tr>
<th>Baud Rate</th>
<th>Data Bits</th>
<th>Parity</th>
<th>Stop Bits</th>
<th>Flow Control</th>
</tr>
</thead>
<tbody>
<tr>
<td>9600</td>
<td>8</td>
<td>None</td>
<td>1</td>
<td>None</td>
</tr>
</tbody>
</table>

6. Establish console communication.

Press <Enter> a few times to establish communication between the OmniAccess AP60/61 Installation Guide and terminal.

7. From the OmniAccess AP60/61 Installation Guide console, access the `apboot` prompt.

Depending on the OmniAccess AP60/61 Installation Guide status, you will see one of the following on your terminal:

- **Autoboot countdown**—The countdown prompt allows you to interrupt the normal startup process and access the `apboot` prompt where provisioning is performed.

  APBoot 1.2.1 (Apr 7 2004 - 08:54:57)

  CPU: AR2313 MIPS-32 at 180 MHz: 16 kB I-Cache 16 kB D-Cache
  Board: Merlot Local Bus at 90 MHz
  DRAM: 32 MB
  POST: passed
  FLASH: 4 MB
  Net: en0 lo0

  Hit any key to stop autoboot: 0

To access the `apboot` prompt, press any key (such as <Enter>) before the timer expires. If the countdown expires before you can interrupt it, turn the device off and then back on.
TFTP time out—If the OmniAccess AP60/61 Installation Guide cannot locate an Alcatel Wireless LAN Switch on its network port, the following type of output is repeatedly displayed:

Loading FLASH image...
Verifying checksum... failed!
BOOTP broadcast 1
DHCP IP address: 10.1.2.250
DHCP subnet mask: 255.255.255.0
DHCP def gateway: 10.1.2.1
DHCP DNS server: 10.1.1.2
DHCP DNS domain: Alcatelnetworks.com
DHCP Alcatel server: 10.1.2.11
Loading elf file: 10.1.2.11:mips.ari
Loading: T T T T T T T T T
Retry count exceeded; starting again

Press <Control-C> to interrupt this process and access the `apboot` prompt.

Once the apboot prompt is displayed, perform provisioning as described in the next section.
Setting OmniAccess AP60/61 Installation Guide Parameters

1. From the `apboot` prompt, configure the host information, if necessary.

   In order to provide centralized management of the APs, each Alcatel AP
downloads its software image and configuration files from a master Alcatel
Wireless LAN Switch.

   Setting the correct host information depends on the following:

   - Does your network use direct IP addresses or DNS with host names?
   - If using host names, is `Alcatel-master` acceptable for the master Wireless
     LAN switch, or do you need to define a different name?

   Depending on your answers, select one of the following steps:

   - **My network uses DNS and the `Alcatel-master` host name is acceptable.**
     
     This is the default. It requires your DNS to be configured to resolve
     “`Alcatel-master`” to the IP address of the master Alcatel Wireless LAN
     Switch. Unless your system has been previously configured for differ-
     ent settings, you can skip to Step 2.
     
     Otherwise, if your system was previously configured for a different
     setup, manually set the `servername` environment variable to the default
     host name:

     ```
     apboot> setenv servername Alcatel-master
     ```

     **NOTE**—The `master` and `serverip` environment variables also affect how AP source files
are selected and should be cleared when using this approach. To clear a variable,
enter the `setenv variable` command with no host name or address value:

     ```
     apboot> setenv master
     apboot> setenv serverip
     ```

     When finished, proceed to Step 2.

   - **My network uses DNS, but I will use a different host name for the
     Wireless LAN switch.**
     
     This requires that the `servername` variable be configured with your cho-
     sen host name for the master Alcatel Wireless LAN Switch. It also
     requires that your DNS be configured to resolve the specified host name
to the IP address of the master Alcatel Wireless LAN Switch.
     
     To manually set the host name, use the following command:

     ```
     apboot> setenv servername <Wireless LAN switch host name>
     ```
NOTE—The master and serverip environment variables also affect how source files are selected and should be cleared when using this approach. To clear a variable, enter the setenv variable command with no host or address value.

When finished, proceed to Step 2.

- **My network uses direct IP addresses instead of DNS.**
  If using direct IP addresses in your network, use the following commands:

    ```shell
    apboot> setenv serverip <Wireless LAN switch IP address>
    apboot> setenv master <Wireless LAN switch IP address>
    ```

    NOTE—If the servername variable is configured in this scenario, it will be ignored.

2 **Specify an IP address for a specific AP, if necessary.**

   If using DHCP, the AP will obtain its IP address automatically and you can skip this step. Otherwise, configure the AP with a static IP address using the following commands:

    ```shell
    apboot> setenv ipaddr <static IP address for the AP>
    apboot> setenv netmask <static IP address mask>
    apboot> setenv gatewayip <default gateway IP address>
    ```

3 **Set the location for the specific AP, if necessary.**

   Location settings depend on how much control you want over configuring logical groups of APs in the future.

   - **Default Locations**
     If you wish all APs treated as a single entity for configuration and accounting purposes, you can use the default location profile (255.255.65535) and skip to Step 5.

     NOTE—If using default locations during initial provisioning, you can later reconfigure the APs to use specific location IDs using the Alcatel Wireless LAN Switch management tools.
Specific Locations

By setting specific location IDs for each AP, you can later apply configuration changes or collect statistics and information for specific groups of APs (for example, all APs on a particular floor in a particular building).

To set a specific location for an individual AP, the following command is used:

```
setenv location <building number>.<floor number>.<device number>
```

where the following fields are required:

- **Building Number**: A unique number (1-254) is required for each building in your campus.
- **Floor Number**: Within any building, a unique number (1-254) is required for each floor.
- **Device Number**: Within any floor, a unique number (1-65534) is required for each access point or air monitor.

If you performed the recommended site survey using the Alcatel RF Plan tool, the location data for all access points and air monitors can be found on the tool’s deployment page (see the *Alcatel RF Plan User’s Guide*).

If you prefer to enter the location data manually, record the location ID you set for each access point and air monitor along with the following:

- **Device Description**: Note the intended function of the device (access point or dedicated air monitor) and a brief description of its service location.
- **X, Y Coordinates**: For each access point and air monitor, measure its X and Y position (in feet) relative to the bottom-left corner of the building plan as seen from overhead. For example:

```
X: 418 ft.
Y: 262 ft.
```

Use the same fixed point and orientation for all floors in a building.
4. Save the configuration and reboot the OmniAccess AP60/61 Installation Guide.

    apboot> save
    apboot> boot

Once the OmniAccess AP60/61 Installation Guide boots, disconnect it and mount it in its intended service location (see Provisioning Access Points on page 25).
CHAPTER 3
AP Deployment

This chapter covers the following topics:

- Physical mounting of the OmniAccess AP60/61 Installation Guide
- Connecting the required cables

Mounting the OmniAccess AP60/61 Installation Guide

When provisioning is complete, mount the OmniAccess AP60/61 Installation Guide at its intended service location.

The OmniAccess AP60/61 Installation Guide Access Points with or without external antennas are intended only for installation in Environment A as defined in IEEE 802.3.af. All interconnected equipment must be contained within the same building, including the interconnected equipment’s associated LAN connections. (When using an external antenna, 5.150 to 5.250 MHz are blocked.)

Select a location as close as possible to the center of the intended coverage area. If necessary, use the Alcatel RF Plan site survey tool to determine the optimum locations for your access points and air monitors.

The service location should be free from obstructions or obvious sources of interference. Normally, the higher you place an access point or air monitor, the better its performance.
If external antennas are used, make sure that they and their associated wiring are located entirely indoors. The OmniAccess AP60/61 Installation Guide and any optional external antennas are not suitable for outside use.

The OmniAccess AP60/61 Installation Guide can be mounted on a wall or suspended from above (not shown) using one of the optional mounting kits (dimensions vary) in the following ways:

![OmniAccess AP60/61 Installation Guide Mounting Options](image)

**Figure 3-1** OmniAccess AP60/61 Installation Guide Mounting Options

**NOTE**—For dimensions, see “Product Specifications”. Allow 5 cm (2”) additional space on the right-hand side for cables. Measurements for the Alcatel 60 depend on attached antennas, which vary.

### Alcatel 60 Detachable Antennas

Before deploying the Alcatel 60, attach the appropriate antennas (not included). The antenna connections should be tightened by hand to avoid overtightening.

The Alcatel 60 has dual Reverse Polarity SMA (RP-SMA) female antenna connectors that accept a variety of high-gain detachable antennas. See Table 3-1 for the list of FCC approved antennas tested for use with the Alcatel 60.

Make sure that all external antennas and their associated wiring are located entirely indoors. The Alcatel 60 Access Points and their optional external antennas are not suitable for outside use.
FCC-Approved Detachable Antennas

The following table lists the antennas which are approved for use with the Alcatel 60.

### Free-Standing Placement

To place the OmniAccess AP60/61 Installation Guide indoors on a flat table or shelf:
1 Flip open the stand located on the back of the OmniAccess AP60/61 Installation Guide:

![OmniAccess AP60/61 Installation Guide - Fold-Out Stand](image)

**FIGURE 3-2** OmniAccess AP60/61 Installation Guide - Fold-Out Stand

2 Place the device on a sturdy table or shelf.

_**CAUTION**—Do not place the OmniAccess AP60/61 Installation Guide in any place where it could fall on people or equipment. For more secure installation, use one of the optional mounting kits._

3 Orient the antennas.

For best performance, swivel the individual antennas (Alcatel 60) or antenna array (Alcatel AP61) so that they are oriented vertically. Once mounting is complete, connect the required cables (see instructions on page 32).
Using the Built-In Mounting Slots

The keyhole-shaped slots on the back of the OmniAccess AP60/61 Installation Guide can be used to attach the device upright to an indoor wall or shelf.

**CAUTION**—Do not use the mounting slots to hang the OmniAccess AP60/61 Installation Guide from the ceiling, sideways, or in any place where it could fall on people or equipment. For more secure installation, use one of the optional mounting kits.

To hang the OmniAccess AP60/61 Installation Guide upright using the mounting slots, perform the following steps.

1. Install two screws in the wall or shelf as shown in Figure 3-3:

![Figure 3-3 Mounting Screw Specifications](image)

**Figure 3-3** Mounting Screw Specifications

If attaching the device to drywall, we recommend using appropriate wall anchors (not included) as shown in Figure 3-4 on page 31.
2 Align the OmniAccess AP60/61 Installation Guide mounting slots to capture the surface screws.

3 Secure the OmniAccess AP60/61 Installation Guide, if desired.

To prevent the unauthorized removal of the OmniAccess AP60/61 Installation Guide from its installed location, use a Kensington MicroSaver Security Cable (not included). Wrap the security cable around an immovable object, insert the cable’s lock into the Kensington Security Slot on the back of the OmniAccess AP60/61 Installation Guide, and turn the key.

4 Orient the antennas.

For best performance, swivel the individual antennas (Alcatel 60) or antenna array (Alcatel AP61) so that they are oriented vertically (see Figure 3-1 on page 26). Once mounting is complete, connect the required cables (see instructions on page 32).
Using the Optional Mounting Kits

Use the optional mounting kit to attach the OmniAccess AP60/61 Installation Guide to a wall, shelf, or ceiling. For installation, see the Alcatel 60/61 Mounting Kit Installation Notes (P/N 031641-00) provided with each kit.

Connecting Required Cables

The OmniAccess AP60/61 Installation Guide Access Points with or without external antennas are intended only for installation in Environment A as defined in IEEE 802.3.af. All interconnected equipment must be contained within the same building, including the interconnected equipment’s associated LAN connections.

Selecting an FE Cable

The 10/100 Mbps Ethernet (FE) port is used to connect the AP to a 10Base-T/100Base-TX (twisted-pair) Ethernet LAN segment. The appropriate FE cable depends on the features required of the FE port:

- **SPOE**
  - When connecting the AP to a device that supports Serial and Power Over Ethernet (SPOE), use an 8-conductor, Category 5 UTP, straight-through FE cable.

    The Alcatel 6000 (with Line Card OAW-LC-2G-24FP), the Alcatel OmniAccess 4324, and the Alcatel OmniAccess 4308 support SPOE.

- **POE**
  - If the connecting device supports only Power Over Ethernet (POE), use a 4- or 8-conductor, Category 5 UTP, straight-through FE cable.

- **Network Only**
  - If the connecting device does not support POE, use a 4- or 8-conductor, Category 5 UTP, FE cable. The port detects MDI/MDX and automatically adjusts for straight-through or crossover cables.

The maximum length for FE cables is 100 meters (325 feet).

When the OmniAccess AP60/61 Installation Guide is installed in an air-handling space, such as above suspended ceilings, as described in National Electrical Code (2002) Article 300.22(C), and Canadian Electrical Code, Sections 2-128, 12-010(3) and 12-100, Part 1, CSA C22.1, POE is required. Also, any FE cable installed in such spaces should be suitable under NEC.
Article 800.50 and marked accordingly for use in plenums and air-handling spaces with regard to smoke propagation, such as CL2-P, CL3-P, MPP, or CMP.

Use the built-in antenna (for the AP61). For the Alcatel 60, use Alcatel AP-ANT-1. For all other antennas, make sure the antenna cable is UL listed and suitable for use in plenums and air-handling spaces, such as CL2-P, CL3-P, MPP, or CMP, and mount the antenna outside of the air-handling space.

Install cables in accordance with all applicable local and national regulations and practices.

For more port and cable details, see Appendix A.

**Connecting Cables & Power**

![CAUTION—To prevent personal injury or damage to equipment, be sure to comply with electrical grounding standards during all phases of installation and operation of the AP. Do not allow the OmniAccess AP60/61 Installation Guide or its attachments to be connected to or make contact with metal or power outlets on a different electrical ground than the device to which it is connected. Also, never connect the AP or Wireless LAN Switch to external storm grounding sources.]

1. Connect one end of the FE cable directly to the OmniAccess AP60/61 Installation Guide FE port.

2. Connect the other end of the FE cable to one of the following:
   - (A) To a network port on the Alcatel Wireless LAN Switch, or
   - (B) To a network hub, router, or switch that has a routable path to the Alcatel Wireless LAN Switch.

   **NOTE**—If the connecting device supplies POE, a straight-through cable must connect the OmniAccess AP60/61 Installation Guide directly to the powering device without any intervening hubs, routers, or other networking equipment.

3. Connect power, if necessary.

The OmniAccess AP60/61 Installation Guide can receive electrical power using the following options:

- **POE**
  - If connecting the OmniAccess AP60/61 Installation Guide to a device that supplies IEEE 802.3af compliant POE no additional power connection is necessary.

- **Power Outlet**
NOTE—When the OmniAccess AP60/61 Installation Guide is installed in an air-handling space, as described in NEC (2002) Article 300.22(C), POE must be used instead of a power outlet.

If local regulations and practices permit, connect the optional AC power adapter (not included) to the DC power socket on the OmniAccess AP60/61 Installation Guide and plug it into an appropriate power outlet.

CAUTION—To prevent personal injury or damage to equipment, use only the AC power adapter certified for this device in the country where it is used.
APPENDIX A

Port Specifications

FE Port

The 10/100 Mbps Ethernet (FE) port is located on the right-hand side of the OmniAccess AP60/61 Installation Guide and has an RJ-45 female connector. The port pin-outs are shown in Figure A-1:

Aruba 60/61 10/100 Mbps Ethernet

RJ-45 Female Pin-Out

1 → ETH Tx+ (POE negative*)
2 → ETH Tx- (POE negative*)
3 → ETH Rx+ (POE positive*)
4 → Serial RxD** (POE positive*)
5 → Serial RGND** (POE positive*)
6 → ETH Rx- (POE positive*)
7 → Serial TxD** (POE negative*)
8 → Serial TGND** (POE negative*)

Direction
Input → Output

*POE optional
**Serial optional

FIGURE A-1 OmniAccess AP60/61 Installation Guide FE Port

The appropriate cable depends on the level of connectivity required of the FE port:

- If the connecting device supports Serial and Power Over Ethernet (SPOE), use an 8-conductor, Category 5 UTP, straight-through FE cable with a male RJ-45 connector. (The Alcatel 6000 (with Line Card OAW-LC-2G24FP), the Alcatel OmniAccess 4324, and the Alcatel OmniAccess 4308 support SPOE.

- If the connecting device supports only Power Over Ethernet (POE, including IEEE 802.3af POE as well as “inline” or “mid-span” POE devices), use an 8- or 4-conductor, Category 5 UTP, straight-through FE cable with male RJ-45 connectors.
If the connecting device does not support Serial or POE, use a 4- or 8-conductor, Category 5 UTP, FE cable with male RJ-45 connectors. The port detects MDI/MDX and automatically adjusts for straight-through or cross-over cables.

The maximum length for FE cables is 100 meters (325 feet).

When the OmniAccess AP60/61 Installation Guide is installed in an air-handling space, as described in NEC (2002) Article 300.22 (C), POE is required. Also, any FE cable installed in such spaces should be suitable under NEC Article 800.50 and marked accordingly for use in plenums and air-handling spaces with regard to smoke propagation, such as CL2-P, CL3-P, MPP or CMP.

Install cables in accordance with all applicable local regulations and practices.

### Serial Breakout Adapter

The optional serial breakout adapter is used to separate the serial communications lines from the OmniAccess AP60/61 Installation Guide FE+SPOE port. This allows the administrator to connect a local serial console directly to the AP and access the `apboot` prompt for manual provisioning.

The serial breakout adapter pin-outs are shown in Figure A-2:

![Figure A-2 Alcatel Serial Breakout Adapter](image-url)
**DB-9 Specification**

The DB-9 connector attaches to the serial port of a console terminal. Communication settings for the port are specified in Table A-1:

<table>
<thead>
<tr>
<th>Baud Rate</th>
<th>Data Bits</th>
<th>Parity</th>
<th>Stop Bits</th>
<th>Flow Control</th>
</tr>
</thead>
<tbody>
<tr>
<td>9600</td>
<td>8</td>
<td>None</td>
<td>1</td>
<td>None</td>
</tr>
</tbody>
</table>

**“To AP” Specifications**

The RJ-45 connector labeled “To AP” attaches to the OmniAccess AP60/61 Installation Guide FE port either directly (if the AP is physically available) or indirectly (if the AP is already deployed).

When connecting indirectly, use a straight-through FE coupler to attach the “To AP” connector to the FE cable leading directly to the AP’s FE port with no intervening hubs, routers, or other network equipment. The cable must be 8-conductor, Category 5 UTP, straight-through FE cable with a maximum length of 100 meters (325 feet).

The OmniAccess AP60/61 Installation Guide and serial breakout adapter are plenum rated. When installed in an air-handling space, as described in NEC (2002) Article 300.22(C), any connecting FE cable should be suitable under NEC Article 800.50 and marked accordingly for use in plenums and air-handling spaces with regard to smoke propagation, such as CL2-P, CL3-P, MPP or CMP.

Install cables in accordance with all applicable local regulations and practices.

**“To Network” Specifications**

The RJ-45 connector labeled “To Network” attaches to an FE LAN segment. This connection is optional unless IEEE 802.11af Power Over Ethernet (POE) is used to power the AP during manual provisioning.

A straight-through FE coupler may be used to attach the “To Network” connector to a LAN FE cable. The appropriate cable depends on the level of connectivity required of the FE port:

- If the connecting device supports IEEE 802.3af Power Over Ethernet (POE), use a 4- or 8-conductor, Category 5 UTP, straight-through FE cable with male RJ-45 connectors.

  The Alcatel OmniAccess 6000 (with Line Card OAW-LC-2G24FP), the Alcatel OmniAccess 4324, and the Alcatel OmniAccess 4308 support SPOE.
Otherwise, use a 4- or 8-conductor, Category 5 UTP, FE cable with male RJ-45 connectors. The port detects MDI/MDX and automatically adjusts for straight-through or crossover cables.

**NOTE**—Only IEEE 802.3af Power Over Ethernet is supported for manual provisioning. “Inline” or “mid-span” POE devices will not work with the Alcatel serial breakout adapter.

The maximum length for FE cables is 100 meters (325 feet).

The OmniAccess AP60/61 Installation Guide and serial breakout adapter are plenum rated. When installed in an air-handling space, as described in NEC (2002) Article 300.22(C), the connecting FE cable should be suitable under NEC Article 800.50 and marked accordingly for use in plenums and air-handling spaces with regard to smoke propagation, such as CL2-P, CL3-P, MPP or CMP.

Install cables in accordance with all applicable local regulations and practices.
Troubleshooting

After provisioning and deployment, the OmniAccess AP60/61 Installation Guide can be configured and managed through the Alcatel Wireless LAN Switch. However, the OmniAccess AP60/61 Installation Guide includes built-in troubleshooting features for situations where the switch commands are unable to diagnose AP problems.

This appendix describes using the built-in AP support prompt for troubleshooting.

Accessing the AP Support Prompt

Depending on your network topology, the built-in AP Support prompt can be accessed using the AP serial console port or through the Wireless LAN switch using the Serial Over Ethernet (SOE) interface or using Telnet from a remote management station.

Direct SPOE Connection to Wireless LAN Switch

This method requires that the OmniAccess AP60/61 Installation Guide is connected directly to an SPOE-compatible network port on the Alcatel Wireless LAN Switch (see “Connecting Required Cables” on page 32).
1. Telnet to the Alcatel Wireless LAN Switch Serial-Over-Ethernet (SOE) interface.
   Use a Telnet client on your management workstation to connect to the Alcatel Wireless LAN Switch IP address using logical port 2300. The connection command may vary depending on the specific software used, but commonly appears as follows:

   ![](image)

2. When prompted, log in to the Alcatel Wireless LAN Switch as the administrator:

   ![](image)

   This will present you with the Alcatel Wireless LAN Switch SOE console prompt:

   ![](image)

3. Connect to the Alcatel Wireless LAN Switch port to which the OmniAccess AP60/61 Installation Guide is physically attached:

   ![](image)

   where *slot number* is the physical slot of the line card in the Wireless LAN switch, and *port number* is the physical port.

   If the AP has not finished booting, allow the Autoboot timer to expire. When the device has booted, the AP support prompt (‘#’) will appear.

**Direct Terminal Connection**

This method requires that the OmniAccess AP60/61 Installation Guide is connected to a compatible serial console using the Alcatel serial breakout adapter (see “Connecting the Console Terminal” on page 16).
1. Set up your local terminal.

This procedure requires a terminal or computer running terminal emulation software with the following settings:

<table>
<thead>
<tr>
<th>TABLE 3-2 Console Terminal Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud Rate</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>9600</td>
</tr>
</tbody>
</table>

2. Establish console communication.

Press <Enter> a few times to establish communication between the OmniAccess AP60/61 Installation Guide and terminal.

If the AP has not finished booting, allow the Autoboot timer to expire. When the device has booted, the AP Support prompt (#) will appear.

Remote Telnet Connection

If properly set up, the AP support prompt can be accessed remotely using Telnet. By default, this feature is turned off for security purposes and cannot be turned on using the AP interface.

Setting Telnet Access

Telnet access can only be changed from the Wireless LAN switch management interface. Log in to the Wireless LAN switch CLI using the admin account, access the configuration (config) prompt, and issue the following commands:

```
(Alcatel 6000) (config) # ap location <building>,<floor>,<device>
(Alcatel 6000) (sap-config location b,f,d) # telnet {enable|disable}
```

Using Telnet to Connect

Use a Telnet client on your management workstation to connect to the OmniAccess AP60/61 Installation Guide’s individual IP address. The connection command may vary depending on the specific software used, but commonly appears as follows:

```
> telnet <OmniAccess AP60/61 Installation Guide IP address>
```

When the connection is established, the AP support prompt (#) will be displayed.
AP Support

Access Levels

- **User Access**
  
  User access is a low security level, featuring only the most basic commands. It is available without any additional login after the AP has booted.

- **Privileged Access**
  
  Privileged-level access requires the privileged password (the same privileged password used on the switch) to be entered using the user level `enable` command. The privileged access level is available only after the AP has successfully booted and synchronized with Wireless LAN switch.

User Commands

- **ping** `<host|IP address>`
  
  Verify IP connectivity between the AP and the host address.

- **route**
  
  Display the contents of the AP route table.

- **ifconfig**
  
  Display the AP’s IP address settings.

- **enable** `<privileged password>`
  
  Access the AP Support privileged mode.

Privileged Commands

In addition to the user commands, the following commands are available upon successfully entering the privileged mode:

- **ps**
- **show [config|stats|version]**

  **NOTE**—These commands should be used only as directed by Alcatel Customer Support.
APPENDIX C
Product Specifications

Compliance

FCC - Class A

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at their own expense.

Any changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate this equipment.

This product complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.
CAUTION STATEMENT: FCC RF Radiation Exposure Statement

This equipment complies with FCC RF radiation exposure limits set forth for fixed indoor use only. This equipment should be installed and operated with a minimum distance of 15.2 inches (38.5 centimeters) between the radiator and your body for 2.4 GHz and 5GHz operations. This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

Radio Frequency Interference Requirements

This device is restricted to indoor use due to its operation in the 5.15 to 5.25 GHz frequency range. The FCC requires this product to be used indoors to reduce the potential for harmful interference to co-channel Mobile Satellite systems. High power radars are allocated as primary users of the 5.25 to 5.35 GHz and 5.65 to 5.85 GHz bands. These radar stations can cause interference with and/or damage this device.

Industry Canada - Class A

This digital apparatus does not exceed the Class A limits for radio noise emissions from digital apparatus as set out in the interference-causing equipment standard entitled “Digital Apparatus,” ICES-003 of the Department of Communications.

Cet appareil numérique respecte les limites de bruits radioélectriques applicables aux appareils numériques de Classe A prescrites dans la norme sur le matériel brouilleur: “Appareils Numériques,” NMB-003 édictée par le ministère des Communications.

VCCI - Class A

この装置は、情報処理装置等電波障害自主規制協議会（V C C I ）の基準に基づくクラス A 情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

CE - Class A

Warning—This is a Class A product. In a domestic environment, this product may cause radio interference in which case the user may be required to take adequate measures.

EU - Class A

This product complies with EN5022 Class A and EN5024 standards.

Underwriter Labs
These products have been Listed and tested for fire resistant and low-smoke-producing characteristics, and are suitable for use in environmental air space, such as above suspended ceilings, in accordance with Section 300-22(C) of the National Electrical Code, and Sections 2-128, 12-010(3) and 12-100 of the Canadian Electrical Code, Part 1, CSA C22.1.

Peut être utilisé dans des gaines transportant de l’air traité, conformément à la section 300-22(c) du National Electrical Code et aux articles 2-128, 12-010(3) et 12-100 du Code Canadien de l’électricité, Première partie, CSA C22.1.

EMC Compliance and Warning Statement

This equipment has been tested and found to comply with the limits of the standard for medical devices, IEC 60601-1-2:2001. The unit also complies with the requirements of EN 60601-1-2:1998, providing the presumption of compliance to the European Union’s Medical Device Directive 93/42/EEC. The limits are designed to provide reasonable protection against harmful interference in a typical medical installation. This equipment generates, uses and can radiate radio frequency energy, and, if not installed and used in accordance with the manufacturer’s instructions may cause harmful interference to other devices in the vicinity. However, there is no guarantee that interference will not occur in a particular installation. If this equipment causes interference with other devices, which may be determined by turning the equipment off and on, the user is encouraged to try and correct the interference by one or more of the following measures:

- Reorient or relocate the device receiving the interference.
- Increase the separation between the equipment.
- Connect the equipment into an outlet on a circuit different from that to which the other device(s) are connected.
- Consult the manufacturer or field service technician for help.

Product Features

- Wireless dual-band transceiver
- Varied antenna options:
  - The Alcatel AP60 has dual Reverse Polarity SMA (RP-SMA) antenna connectors that accept a variety of high-gain detachable antennas (not included).
  - The Alcatel AP61 has a built-in swivel array with dual, tri-band, omnidirectional antennas for reception diversity.
- Protocol-independent networking functionality
- Supports IEEE 802.11a or IEEE 802.11b/g operation as an AP
- Supports IEEE 802.11a and IEEE 802.11b/g operation as an AM
- Compatible with IEEE 802.3af Power Over Ethernet (POE)
- Seamless connectivity to wired LANs augment existing networks quickly and easily
- Can be centrally managed, configured, and upgraded through the Alcatel Wireless LAN Switch to take advantage of network changes and security improvements

Ethernet Compatibility
The OmniAccess AP60/61 Installation Guide attaches to 10/100 Mbps Ethernet (FE) LAN segments that utilize 10Base-T/100Base-TX (twisted-pair) wiring. The device appears as an Ethernet node and performs a routing function by moving packets between the wired LAN and remote workstations on the wireless infrastructure.

Radio Characteristics
The OmniAccess AP60/61 Installation Guide can be configured to support IEEE 802.11a or IEEE 802.11b/g operation as an AP, and supports both IEEE 802.11a and IEEE 802.11b/g operation as an AM:

- 802.11a provides a high data rate and reliable wireless connectivity
  802.11a operation uses a radio modulation technique known as Orthogonal Frequency Division Multiplexing (OFDM), and a shared collision domain (CSMA/CA). It operates in the 5GHz Unlicensed National Information Infrastructure (UNII) band. Data is transmitted over a half-duplex radio channel operating at up to 54 Megabits per second (Mbps).

- 802.11b provides an alternative to wired LANs that can dramatically cut costs
  802.11b operation uses the IEEE 802.11 High-Rate Direct Sequence (HRDS) specification, and a shared collision domain (CSMA/CA). It operates in the 2.4GHz Industrial/Scientific/Medical (ISM) band. The ISM band is available worldwide for unlicensed use. Data is transmitted at speeds of up to 11 Mbps.
802.11g provides a high data rate and is backwards compatible with 802.11b.
802.11g operation uses ODFM and a shared collision domain (CSMA/CA). It
operates in the 2.4GHz Industrial/Scientific/Medical (ISM) band. The ISM band is
available worldwide for unlicensed use. Data is transmitted at speeds of up to 54 Mbps.

Power Over Ethernet

The OmniAccess AP60/61 Installation Guide supports the IEEE 802.3af standard for Power Over Ethernet (POE). With this feature, the OmniAccess AP60/61 Installation Guide can accept electrical power from a compatible POE-capable device (such as the Alcatel OmniAccess 6000 (with Line Card OAW-LC-2G24FP), Alcatel OmniAccess 4324, or Alcatel 800) directly over the FE cable. POE eliminates the need to provide separate power outlets in environments that are difficult or undesirable to wire for electricity.

The OmniAccess AP60/61 Installation Guide also supports “inline” and “midspan” POE devices for normal operation. Inline power is POE that is integrated into FE ports and provides POE directly to devices. Non-POE ports can have POE added by means of a mid-span device that provides POE. The non-POE port is connected to a mid-span POE port, and this mid-span port is connected to the device that requires POE.

Disposal of AP60/61

When the useful life of the Access Point has expired, be sure to dispose of the unit in accordance with all local code and environmental regulations. Contact your local waste management or environmental agencies for details.

Physical Description

Package Contents

The OmniAccess AP60/61 Installation Guide package includes:

- One OmniAccess AP60/61 Installation Guide Wireless LAN Switch
- Assorted documentation

Inform your supplier if there are any incorrect, missing or damaged parts. If possible, retain the carton, including the original packing materials. Use them to repack the product in case there is a need to return it.
Optional Items

The following optional items can also be ordered for the OmniAccess AP60/61 Installation Guide:

- Detachable antennas (Alcatel AP60 only)
- AC power adapter (5 VDC, 3 A) and power cord
- Serial breakout adapter for direct access to the AP console
- Mounting kit (modular cradle for walls and suspended ceilings)

Check with your Alcatel sales representative for the availability of optional items.

The following specifications apply to the Alcatel AP60 and Alcatel AP61 Wireless LAN Switchs.
