

# **AOS-CX Switch Introduction and Interoperability with AOS-S Switches**

---

Holger Hasenaug, CSE  
Jan, 2024

# Agenda Details

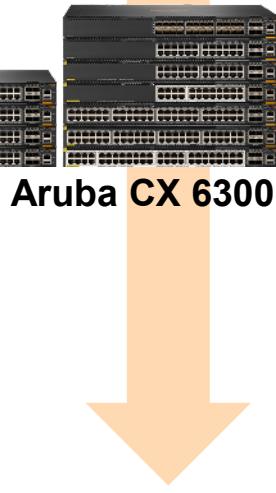

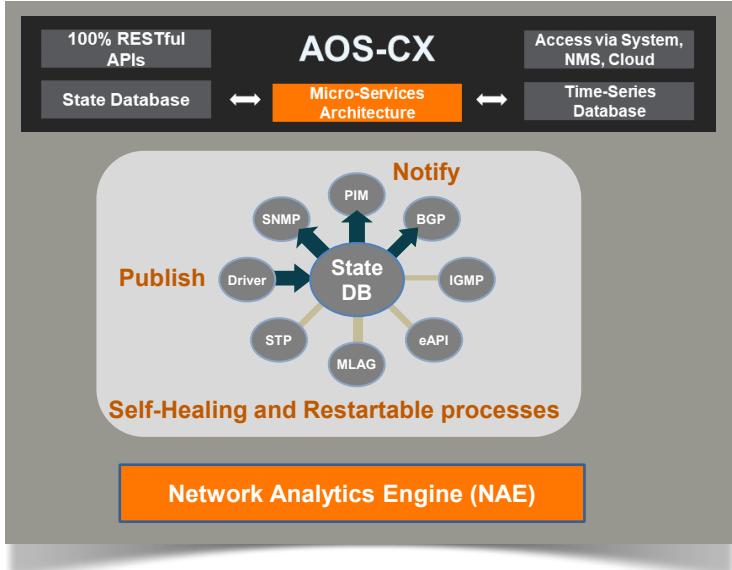

---

- AOS-CX Overview
- CLI philosophy and configuration defaults
- Layer-2 configurations
  - Ethernet interface ranges and how to reset an interface to its default values
  - VLANs
    - VLAN Interoperability
    - VLAN ranges
  - Link-Aggregation
    - Link Aggregation Interoperability
- Layer-3 configurations
  - Layer-3 VLAN-Interface
  - L3 VLAN interface ranges
  - Layer-3 Interface
- Additional Resources

# AOS-CX Overview

# Aruba CX Switching Portfolio

Aruba CX 6400

Aruba CX 8400

Ruggedized  
Aruba CX 4100i

End-to-End Portfolio for the Enterprise

# Aruba CX Switching

Next-gen switching designed for the network operator

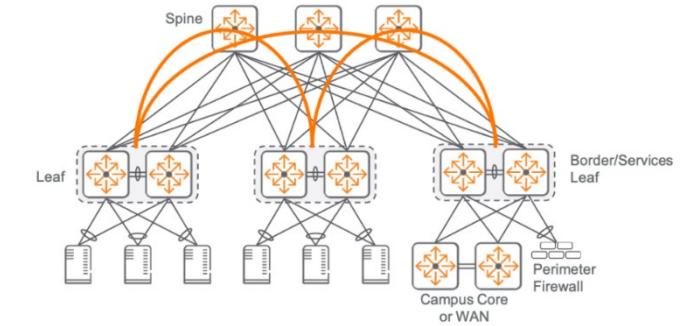

## Simplicity from access to data center with AOS-CX

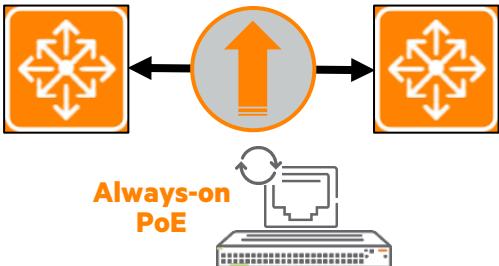

## Unified mgmt and intelligent configs with Aruba Central

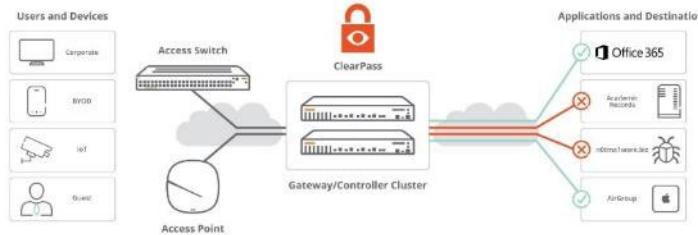

## Campus and DC Fabrics with BGP-EVPN VXLAN with GBP

## High Availability with Aruba VSX or VSF Live Upgrades

## IoT and User Security Aruba Dynamic Segmentation

## Data center class performance with Gen7 ASIC

# AOS-CX Operating System

Built on cloud-native principles

## Modularity

Faster innovation  
with independent processes

## Programmability

Simplified  
operations  
through automation

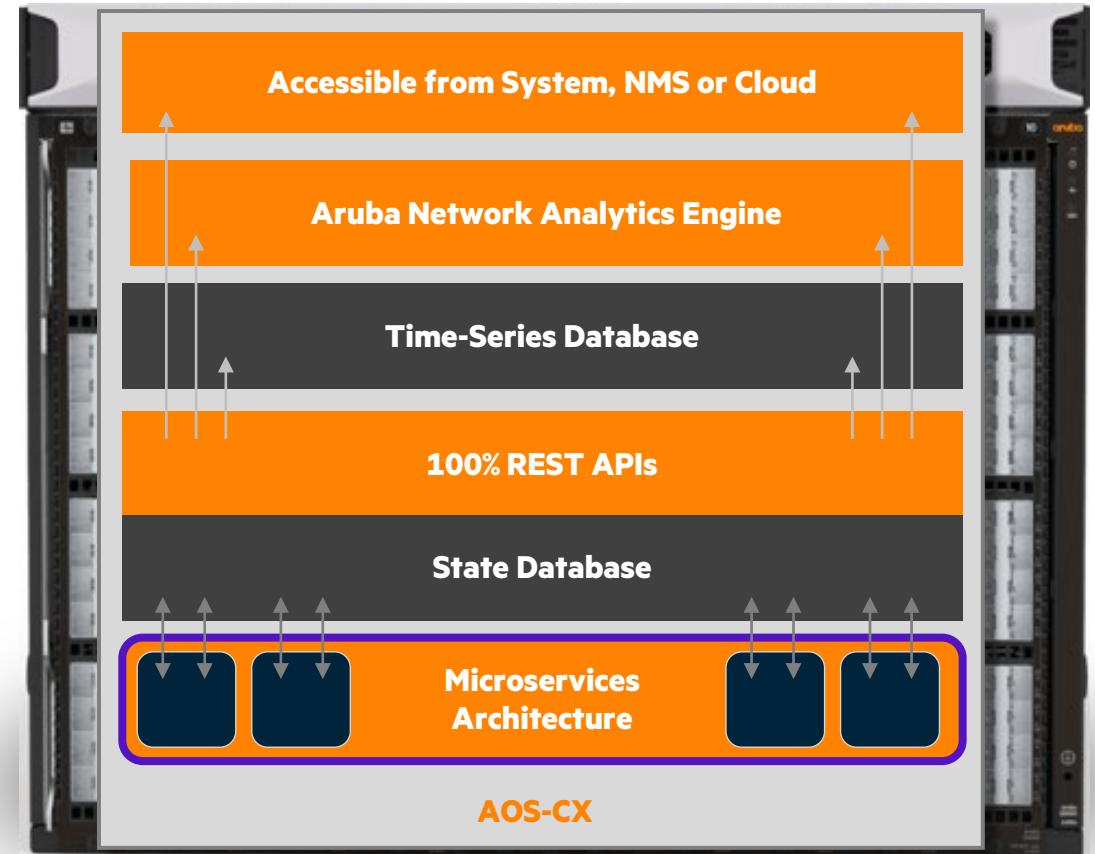

## Resiliency

Stable and reliable  
microservices  
design

## Elasticity

One operating model from  
edge access  
to data center

Gartner®

# Simplify Operations with a Unified Infrastructure

Unique switch architecture provides management choice

## Web GUI

**Web interface** for single switch network management

## CLI

## NetEdit

for AOS-CX

## COP (Central on-prem)

On-prem wired + wireless access network management

## Fabric Composer

Software-defined orchestration solution for enterprise data center networks

## Central

**Cloud-based wired + wireless + SD-WAN**  
network management

# CLI Configuration

# **CLI philosophy and configuration defaults**

The background of the slide features a dynamic, abstract design composed of several thick, curved bands. These bands are primarily colored in shades of red, orange, and yellow, creating a sense of motion and depth. The curves are smooth and organic, resembling waves or the folds of a fabric. The overall effect is modern and visually appealing, providing a vibrant contrast to the white text area.

# AOS-CX CLI Philosophy

---

- Intuitive
- Simple
- Short
- Consistent
- Commands are generally based on industry standard
  - Port-based configuration vs. VLAN-based
  - Port-based configuration vs. feature-based
  - The “no” form of a command accept all parameters, even if they are unnecessary in the “no” form
  - Enable/Disable commands for specific features

# Industry standard-based CLI

## Configuration Example

### Link-Aggregation:

```
interface lag 100
    no shutdown
    description VSX-link
    no routing
    vlan trunk native 1
    vlan trunk allowed 1,10,20,30,40,201
    lacp mode active
interface 1/1/2
    no shutdown
    description vsx-link1
    lag 100
interface 1/1/3
    no shutdown
    description vsx-link2
    lag 100
```

### VRF Configuration global:

```
vrf guest
```

### OSPF Configuration global:

```
router ospf 1
    router-id 99.99.99.2
    passive-interface default
    area 0.0.0.0
```

### Layer-3 Interface Configuration:

```
interface vlan201
    vrf attach guest
    ip address 10.0.201.2/24
    ip ospf 1 area 0.0.0.0
    no ip ospf passive
```

# CX Access Switch Defaults

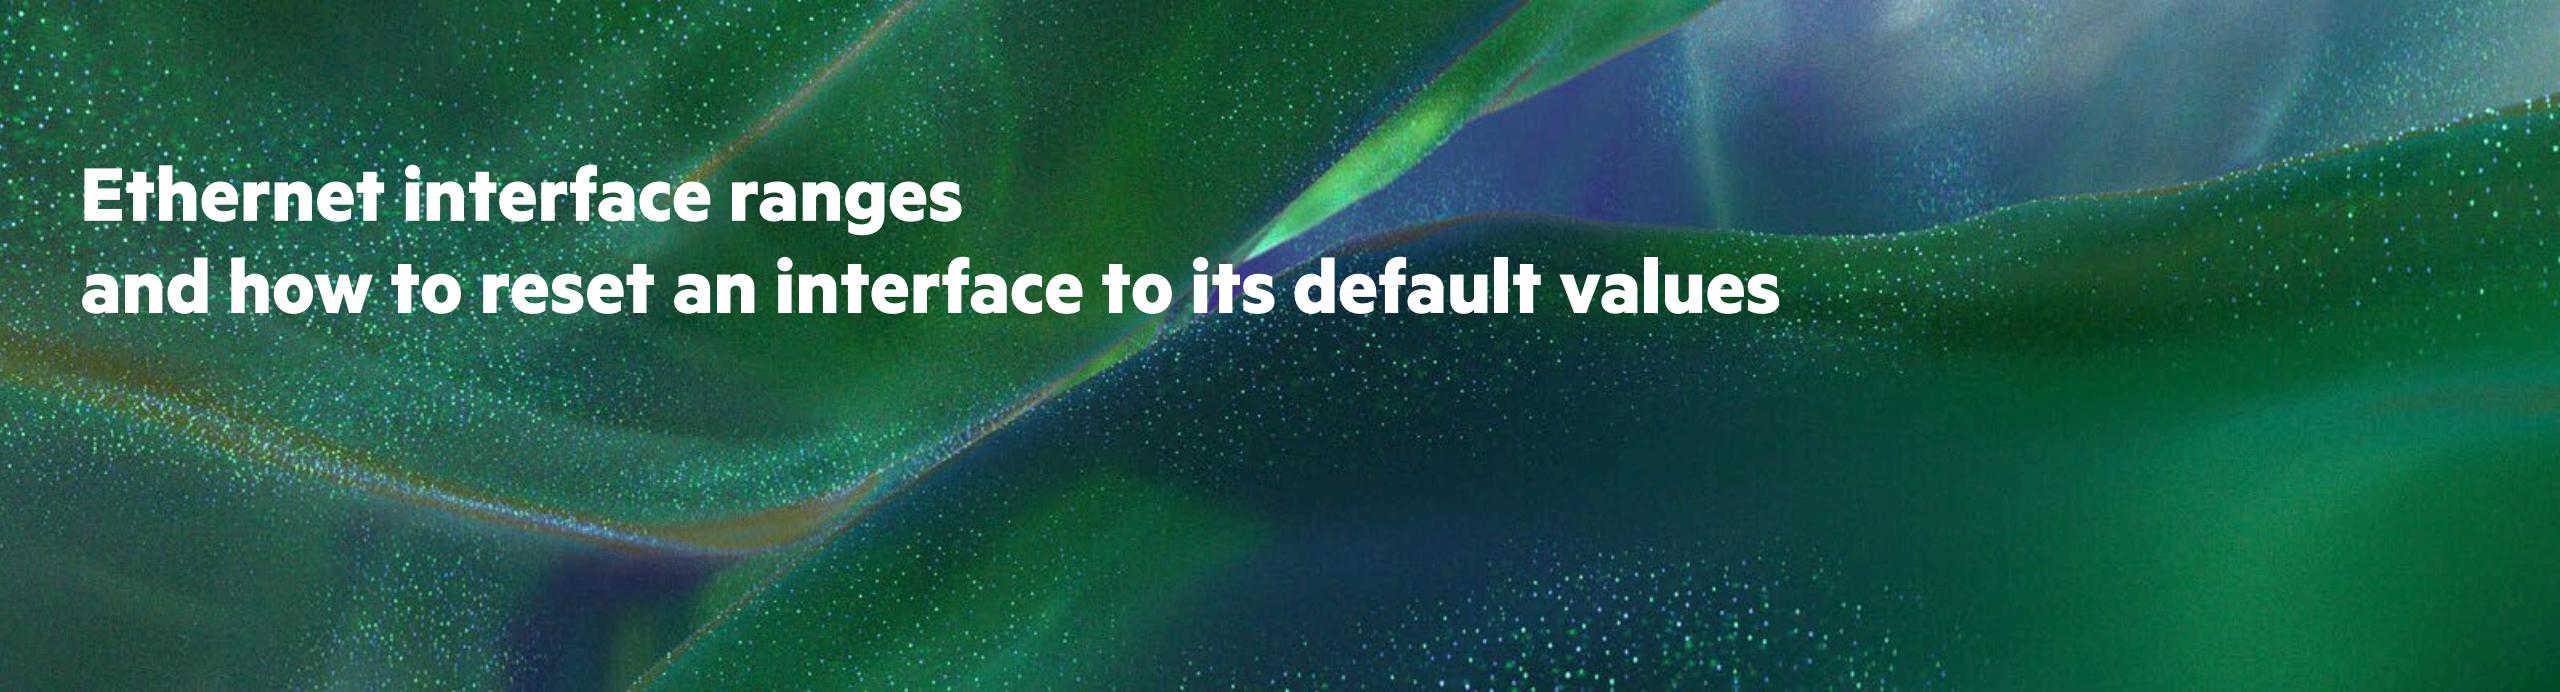

---

- Default configuration of an CX Access switch (6xxx)
  - Ports/interfaces are:
    - L2 or Bridging by default
    - Members of vlan-1 in access mode by default
    - Admin "up" by default (no shutdown)
  - “interface vlan 1” or SVI for vlan-1 is created by default
    - DHCPv4 is enabled on interface vlan-1 by default
    - ZTP is enabled on interface vlan-1 by default
  - HTTP service, REST in read/write mode and WebGUI are enabled by default on “mgmt” and “default” VRF
  - SSH server is enabled in “mgmt” and “default” VRF
  - **Spanning-Tree is enabled by default**

## **Layer-2 configurations**

# **Ethernet interface ranges and how to reset an interface to its default values**

## Configuring a range of Physical interfaces

- Range contexts can be created by specifying the interface range using the below CLI in global configuration context.
  - ‘interface <RANGE>’
- Range can be specified using a hyphen ( - ) and / or a comma separated list.

```
Switch(config)# interface 1/1/1,1/1/7-1/1/8
Switch(config-if-<1/1/1,1/1/7-1/1/8>)#
```
- On successfully configuring a range of interfaces, the range shall appear on the context prompt

# How to reset an interface to its default values?

```
default interface <INTERFACE-ID>
```

## Description

Sets an interface (or a range of interfaces) to factory default values.

Parameter	Description
<INTERFACE-ID>	Specifies the ID of a single interface or range of interfaces. Format: <b>member/slot/port</b> or <b>member/slot/port-member/slot/port</b> to specify a range.

## Examples

On the 6400 Switch Series, interface identification differs.

Resetting an interface:

```
switch(config)# default interface 1/1/1
```

Resetting a range of interfaces:

```
switch(config)# default interface 1/1/1-1/1/10
```

# VLANs

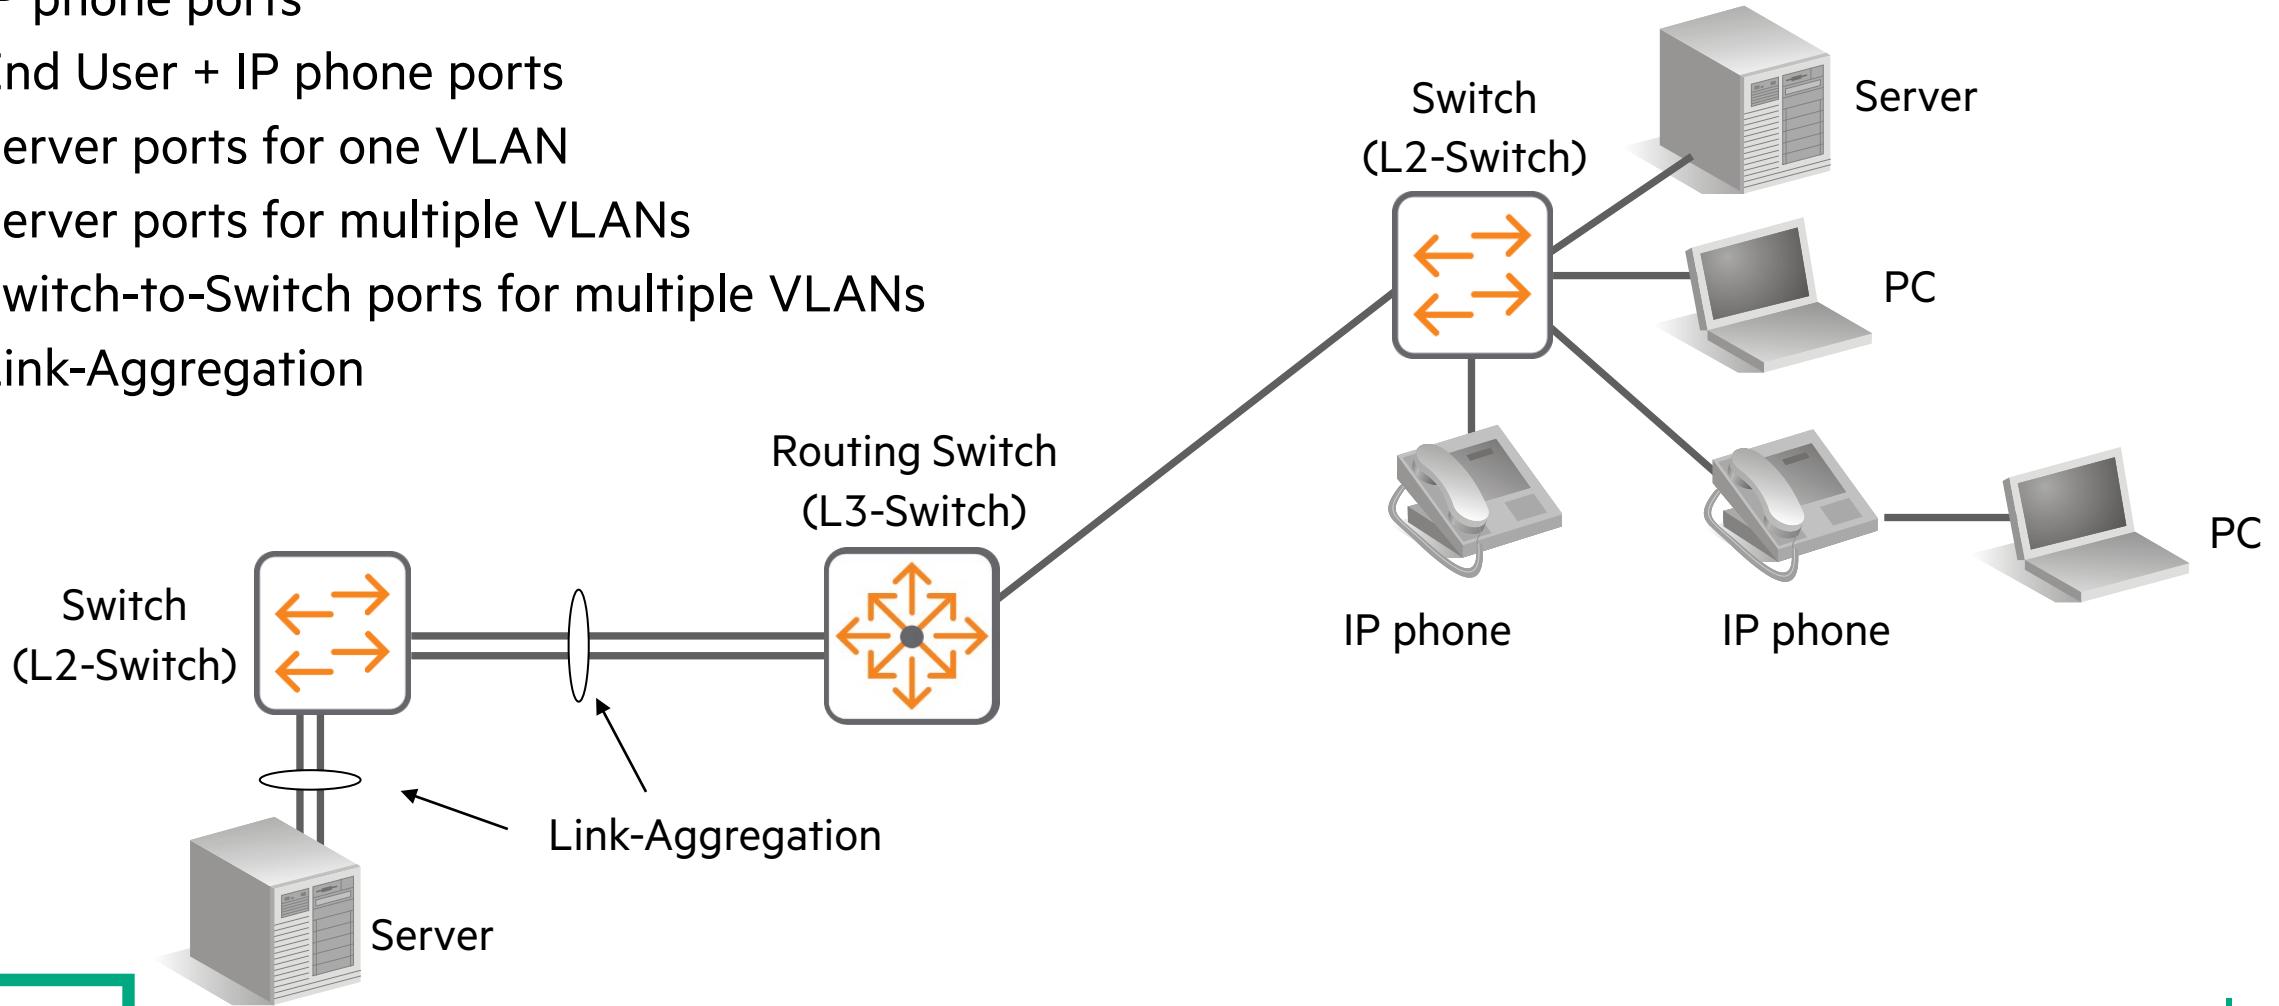

# VLAN Interoperability

# Switch Port Roles

- End User ports (PCs, Printer,...)
- IP phone ports
- End User + IP phone ports
- Server ports for one VLAN
- Server ports for multiple VLANs
- Switch-to-Switch ports for multiple VLANs
- Link-Aggregation

# Terminology Differences

Switch Port Role	AOS-S Switch	AOS-CX Switch
<b>End nodes: PCs, printers, and so on</b>	Untagged port	Access port
<b>PC + IP Phone</b>	Untagged in data VLAN; tagged in voice VLAN	Trunk port with tagged voice VLAN
<b>Switch-to-switch with multiple VLANs</b>	Tagged port	Trunk port
<b>Link aggregation</b>	Trunk port	Link Aggregation

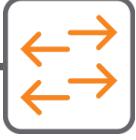

# VLAN Configuration Comparison

## Switch-to-Switch connection

# VLAN ranges

## Configuring a range of L2 VLANs

- Range context for VLANs can be created by specifying the VLAN range using the below CLI in global configuration context.
  - ‘vlan <RANGE>’

- Range can be specified using a hyphen ( - ) and / or a comma separated list.

```
Switch(config)# vlan 11,12-20
```

```
Switch(config-vlan-<11,12-20>)#
```

- The range can be specified in any order. User is taken to a context with the range displayed on the prompt.

```
Switch(config)# vlan 10,9,8
```

```
Switch(config-vlan-<10,9,8>)#
```

# Link Aggregation

# **Layer-3 configurations**

# **Layer-3 VLAN-Interface**

# Layer-3 Interfaces (VLAN-based)

# Layer-3 Interfaces (VLAN-based)

AOS-S Switch	AOS-CX Switch
<b>Layer-3 VLAN configuration:</b> <pre>vlan 100   untagged a1   ip address 1.1.1.2 255.255.255.252</pre>	<b>Layer-3 VLAN configuration:</b> <pre>vlan 100   interface 1/1/2     no shutdown     no routing     vlan access 100   interface vlan 100     no shutdown     ip address 1.1.1.1/30</pre>
<b>Enabled layer-2 protocols by default:</b> <ul style="list-style-type: none"><li>- HP stacking (on most switches)</li><li>- LLDP</li></ul>	<b>Enabled layer-2 protocols by default:</b> <ul style="list-style-type: none"><li>- LLDP</li><li>- Spanning-Tree</li></ul>
<b>Layer-2 protocols need to be disabled per port if globally enabled:</b> Spanning-tree: <pre>(config)# spanning-tree a1 bpdu-filter</pre>	<b>Layer-2 protocol to be disabled per port:</b> Spanning-tree: <pre>interface 1/1/2   spanning-tree bpdu-filter</pre>

A separate VLAN for the transfer layer-3 network is required

## L3 VLAN interface ranges

## **Configuring a range of L3 VLANs ( Interface VLAN )**

- Range contexts can be created by specifying the interface VLAN range using the below CLI in global configuration context.

- ‘interface vlan <RANGE>’

- Range can be specified using a hyphen ( - ) and / or a comma separated list.

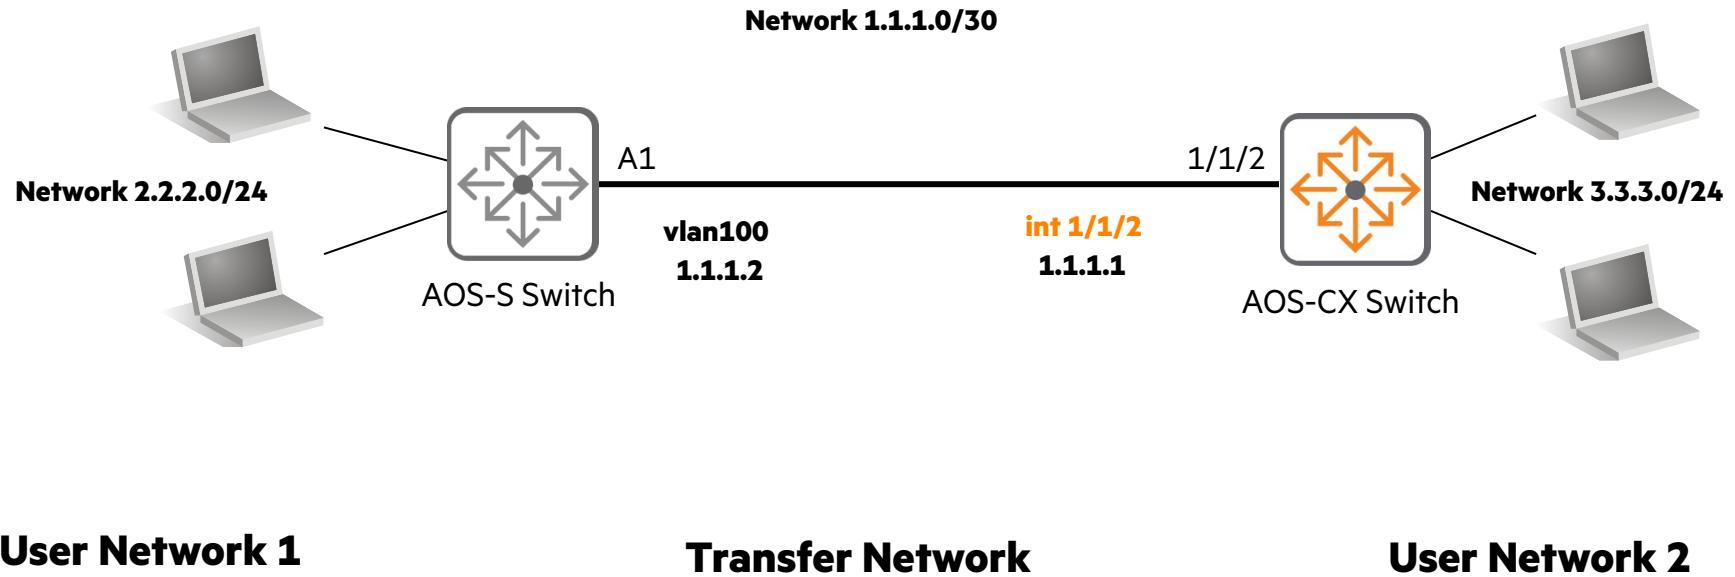

```
Switch(config)# interface vlan 1-3,5-6
```

```
Switch(config-if-vlan-<1-3,5-6>)#
```

- Any Interface VLAN can only be created if corresponding VLAN is already configured. If one or more interface vlans does not have corresponding VLAN(s) configured, they shall not be configured, and user will not be taken to the range context.

# Layer-3 Interfaces (interface-based)

# **Layer-3 VLAN-Interface**

# Layer-3 Interfaces (interface-based)

AOS-S Switch	AOS-CX Switch
<b>Layer-3 VLAN configuration:</b> <pre>vlan 100   untagged a1   ip address 1.1.1.2 255.255.255.252</pre>	<b>Layer-3 interface configuration:</b> <pre>interface 1/1/2   no shutdown   routing   ip address 1.1.1.1 255.255.255.252</pre>
<b>Enabled layer-2 protocols by default:</b> <ul style="list-style-type: none"><li>- HP stacking (on most switches)</li><li>- LLDP</li></ul> <b>Layer-2 protocols need to be disabled per port if globally enabled:</b> Spanning-tree: <pre>(config)# spanning-tree a1 bpdu-filter</pre>	<b>Enabled layer-2 protocols by default on L3 interface:</b> <ul style="list-style-type: none"><li>- LLDP</li></ul>

Campus Deploy / Campus Network Overview  
26-Oct-23

### Deploying the Campus Network

The design referenced in this deployment guide is a large campus topology, described in the Aruba ESP Campus design guide. This topology implements a traditional 3-tier network using a routed core connected to an aggregation layer, which is then connected to the access layer. The access layer is deployed as Layer 2 only and default gateways are implemented at the aggregation layer. This design calls for a services aggregation block connected to the core to ensure efficient delivery of services to endpoints across the campus. All switches and gateways are configured with an IP address in the management VLAN.

The connections between the core and aggregation layers are Layer 3 and consist of point-to-point interfaces using the IP address range of 172.18.XX. Shared services such as Active Directory, DHCP, DNS, and ClearPass are connected to the services aggregation layer which has address spaces in the 10.XXX range. The wireless network rides on top of the wired network using APs connected in the access switches and AOS 10 gateways dual-connected in the services aggregation switches. The physical layout of the network with switches, APs and gateways, as well as the Layer 2 and Layer 3 domains, are shown in the following diagram.

#### Campus Topology

The diagram illustrates a 3-tier campus network topology:

- Services Aggregation (L3):** Contains AOS 10 Gateways, ClearPass, and a Services Aggregation block. It connects to the Internet (SGI/TE) and the Central Aruba Cloud Services.
- Standalone Core (L3):** Contains three core switches connected to the Services Aggregation block.
- Access Aggregation (L3):** Contains four aggregation switches, each connected to three access switches. These access switches serve as Layer 2 domains.
- Wired Access (L2):** Shows individual access points (APs) connected to the access switches.
- Wireless Access:** Shows individual APs connected to the access switches.

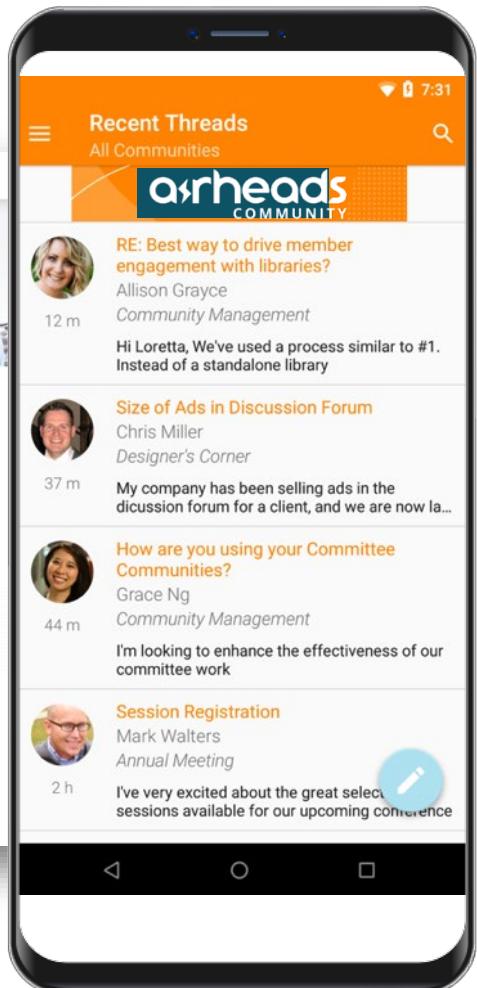

**Legend:**

- Layer 3 (Solid line)
- Layer 2 (Dashed line)

VSG content for HPE Employees

# Aruba Airheads Community

The screenshot shows the Aruba Airheads Community website. At the top, there's a banner for 'Wired Intelligent Edge' with a photo of people in an office. Below it, a navigation bar includes 'Discussion', 'Support', 'Technical Product Details', 'Community Learning', 'News', 'Events', and 'REGISTER | SIGN IN'. The main content area shows a discussion thread titled 'LAG between two 8320 clusters for multiple VLANs'. The post was made by 'split1202' on Nov 18, 2022, at 06:53 PM. The post discusses setting up LAGs between two VSX clusters, one with 2 Fiber 8320s and one with 2 Ethernet 8320s, each having its own VLAN. It also mentions trying to set up another LAG between them. Another user, 'Mark Walters', responded with excitement about session registration for an annual meeting.
